Chemical Review Committee

Eleventh meeting

Rome, 26–28 October 2015

Item 5 (c) (iii) of the provisional agenda*

**Technical work: review of notifications of final
regulatory action: carbosulfan**

**Carbosulfan: supporting documentation provided by Burkina
Faso, Cabo Verde, Chad, the Gambia, Mauritania, the Niger,
Senegal and Togo**

Note by the Secretariat

As referred to in document UNEP/FAO/RC/CRC.11/7, the annex to the present note sets out documentation received from Burkina Faso, Cabo Verde, Chad, the Gambia, Mauritania, the Niger, Senegal and Togo to support its notification of final regulatory action for carbosulfan. The present note, including its annex, has not been formally edited.

* UNEP/FAO/RC/CRC.11/1.

Annex

Carbosulfan: supporting documentation provided by Burkina Faso, Cabo Verde, Chad, the Gambia, Mauritania, the Niger, Senegal and Togo

List of documents:

1. Decision N°007/MAE-MC/2015 – Portant interdiction de l'atrazine (French and English).
2. Annex to the decision to ban Carbosulfan (French and English).
3. Final report – Pilot Study on Agricultural Pesticide Poisoning in Burkina Faso.
4. Institut du Sahel Liste positive des pesticides autorisés à la 34ème session ordinaire du Comité Sahélien des Pesticides.
5. Carbosulfan Footprint PPDB, 2014.
6. Pesticide manual, 11th edition.
7. INERIS – Carbosulfan.
8. Wikipedia – Carbosulfan.

LE MINISTRE COORDONNATEUR

Décision N° 207/MAE-MC/2015
Portant interdiction du carbosulfan

Le Ministre Coordonnateur,

Vu la version révisée de la Réglementation Commune aux Etats membres du CILSS sur l'Homologation des Pesticides, issue de la Résolution n°08/34/CM/99 prise par le Conseil des Ministres du CILSS en 1999 à NDjaména, Tchad.

Soucieux de la protection de la santé humaine, animale et de l'environnement ;

Sur proposition du Comité Sahélien des Pesticides en sa séance de travail du 26 au 30 Mai 2014 à Bamako.

Décide

Article 1^{er} / Le carbosulfan est interdit dans les Etats membres du CILSS pour les raisons énoncées dans le document joint en annexe, en tenant compte des spécificités agricoles et des délais d'utilisation des stocks existants.

Article 2/ La présente décision prend effet à compter de sa date de signature, sera communiquée partout où besoin sera.

Fait à N'Djamena, le 08 AVR 2015

Le Ministre de l'Agriculture et de l'Environnement
Ministre Coordonnateur du CILSS

Mme BAÏWONG DJIBERGUI AMAÏE ROSINE

AMPLIATIONS :

- Secrétariat Exécutif du CILSS (Original)
- Auditeur Interne
- Institut du Sahel (CSP)
- Etats membres du CILSS signataires de la réglementation commune (09)

The Coordinating Minister

Decision 007 MAE/MC2015

Banning Carbosulfan

Considering the revised version of the Regulation common to the CILSS states on pesticides registration from Resolution n° 08/34/CM/99 adopted by CILSS Council of Ministries in NDjamena, Chad in 1999

Concerned about the protection of human and animal health as well as the environment

On a proposal of the Sahelian Pesticide Committee during its working session from 26th to 30th May in Bamako

Decides

Article 1. Carbosulfan is banned in CILSS Member States for the reasons stated in the annex attached, taking into account the agricultural specificities and deadlines to use existing stocks

Article 2. This decision shall take effect from the date of its signature and shall be communicated wherever required.

NDjamna

Minister of Agriculture and the Environment

Coordinating Minister

COMITE PERMANENT INTER-ETATS DE LUTTE CONTRE LA SECHERESSE DANS LE SAHEL
PERMANENT INTERSTATE COMMITTEE FOR DROUGHT CONTROL IN THE SAHEL

Comité Sahélien des Pesticides

Annexe à la décision d'interdiction du carbosulfan

Novembre 2014

1. Généralités sur le carbosulfan

Le carbosulfan ($C_{20}H_{32}N_2O_3S$) est un insecticide carbamate utilisé contre les locustes et plusieurs genres de sauterelles (CSP, 2011). Il a été introduit par la compagnie américaine FMC corp. (The pesticide manual, 1994).

2. Données toxicologiques

Le carbosulfan appartient à la classe II (modérément dangereux) de l'OMS (Footprint, 2011 ; WHO, 2008). C'est un inhibiteur des cholinestérases (FAO, 2003).

2.1. Intoxication aiguë

Le carbosulfan a une toxicité aiguë modérée pour les mammifères. La DL50 orale est de 101 mg / kg chez le rat (Footprint PPDB, 2014). La DL50 pour le carbosulfan était > 2000 mg / kg de poids corporel chez les lapins traités par voie cutanée et la CL50 était de 0,61 mg / l chez les rats traités par inhalation (FAO, 2003).

Les signes d'intoxication diffèrent selon la voie d'exposition :

En cas d'ingestion, on observe : une inhibition durable des cholinestérases de la plupart des tissus et notamment du S.N.C., des muscles et du sang avec accumulation d'acétylcholine ; des signes digestifs précoces et d'intoxications muscariniques : nausées, vomissements, douleurs digestives et diarrhée, myosis, hyper salivation, défécation, mictions involontaires, bradycardie, hypo TA, dyspnée asthmatiforme ; des signes d'intoxication nicotinique : fasciculations et crampes musculaires, mouvements involontaires et paralysie des muscles respiratoires puis tachycardie, HTA, confusion, ataxie, coma convulsif, risque de choc hémodynamique.

En cas d'inhalation, on observe le même mécanisme d'action qu'au niveau d'ingestion ; des signes digestifs moins marqués ; des symptômes respiratoires très précoces dyspnée asthmatiforme, hypersécrétion bronchique ; apparition rapide des signes d'intoxication muscarinique et nicotinique.

En cas d'intoxication aiguë locale, on observe une irritation et une bonne pénétration pour la peau et une irritation avec larmolements et conjonctivite pour l'œil.

2.2. Intoxication chronique

✓ *Effets cancérigènes*

Compte tenu de l'absence de génotoxicité et l'absence de cancérogénicité chez les rats et les souris, il a été conclu que le carbosulfan est peu susceptible de présenter un risque cancérogène pour l'homme (FAO, 2003). Selon Footprint PPDB (2014), le carbosulfan n'est pas cancérogène.

✓ *Effets sur la reproduction et le développement*

Dans une étude sur trois générations de toxicité pour la reproduction, le carbosulfan a été administré à des doses de 10, 20 et 250 ppm. Aucun effet sur l'indice d'accouplement, l'indice de gestation et le nombre de fœtus viables n'a été observés. A la dose de 250 ppm, le poids des petits, la taille des portées et la survie des nouveau-nés ont diminué, de même que les poids corporels des parents mâles et les femelles à cette dose. Chez les parents, la NOAEL était de 20 ppm, ce qui équivaut à 1,3 mg / kg de poids corporel par jour, sur la base de la diminution du poids corporel. La NOAEL pour la toxicité chiot était de 20 ppm sur la base des réductions de la taille des portées, le poids corporel des petits et le gain de poids corporel chiot. La NOAEL pour la toxicité de la reproduction était de 250 ppm, soit 17 mg / kg de poids corporel par jour, la dose la plus élevée (FAO, 2003).

3. Données environnementales

✓ *Comportement et devenir du pesticide dans l'environnement :*

Le carbosulfan est non mobile ($K_{oc} = 9489$ mL/g) (Footprint, 2011). Il ne présente donc pas de risque de contamination des eaux superficielles par ruissellement. Il n'est pas persistant dans le sol ($DT_{50} = 21$ jours). Le carbosulfan présente un risque faible de contamination des eaux souterraines au regard de l'indice GUS qui est de 0,89 (Footprint, 2014).

Dans les expériences d'adsorption / désorption, le carbosulfan, le carbofuran et le dibutylamine ont été comparés au DDT et au 2,4-D dans quatre sols allant de sable fin à argilo-sableux limoneux avec des valeurs de pH entre 5 et 7. Le carbosulfan était plus étroitement lié à chaque type de sol que le 2,4-D et le carbofuran, mais pas aussi bien que le DDT. Par ailleurs, le carbosulfan a été dégradé en carbofuran sur le limon et l'argile (FAO, 1985).

Cette même étude confirme les résultats montrant le faible potentiel de lessivage du carbosulfan mais une dégradation substantielle et élution de ses métabolites, principalement le carbofuran. Le principal métabolite du carbosulfan est le carbofuran (FAO, 1985).

Il a un coefficient de partage octanol/eau élevé (Log P = 7,42) et un facteur de bioaccumulation préoccupant (BCF = 990) (Footprint PPDB, 2014).

✓ ***Effets sur les organismes non cibles:***

Le carbosulfan a une toxicité élevée pour les oiseaux (DL₅₀ *Anas platyrhynchos* = 10 mg/kg), les poissons (CL₅₀ 96h *Lepomis macrochirus* = 0,015 mg/L), les invertébrés aquatiques (EC₅₀ 48h *Daphnia magna* = 0,0032 mg/L) et les abeilles (DL₅₀ 48h = 0,18 µg/abeille) (Footprint PPDB, 2014).

4. Homologation et utilisation du carbosulfan

Au niveau de l'Union Européenne, le carbosulfan est exclu de l'annexe I de la directive 91/414/CEE par la décision n°2007/4/5/CE du 13 juin 2007. Mais, il a fait l'objet d'une ressoumission (Footprint, 2011 ; JO, 2007). De nos jours, il n'est homologué dans aucun pays de l'UE (Footprint PPDB, 2014).

En France, il a été interdit à partir du 13/12/2008 (JO, 2007). En Australie par contre, il est autorisé (APVMA, 2011 ; Footprint PPDB, 2014).

Au niveau des pays du CILSS, quatre formulations à base de carbosulfan avaient reçu l'autorisation provisoire de vente (APV) et ce, depuis 1996 pour la première APV. Deux autres formulations étaient maintenues en étude depuis 2005. Mais à partir de 2006, aucune formulations à base de carbosulfan n'a été homologuée par le Comité Sahélien des Pesticides (CSP) (CSP, 2011 ; Toe, 2007).

5. Le cas du Burkina Faso

Au cours d'une étude pilote réalisée au Burkina Faso en juin 2010 au moyen d'enquêtes rétrospectives et prospectives, 296 cas d'intoxication survenus au cours de l'application des pesticides ont été recensés. Seule une formulation à base de carbosulfan a fait ainsi l'objet d'un cas d'intoxication. Il s'agit du PROCOT 40 WS, une formulation ternaire contenant du carbosulfan (250 g/kg), du carbendazim (100 g/kg) et du metalaxyl-M (50 g/kg).

Il est aussi ressorti de cette étude qu'aucun producteur n'a de suivi médical ou de prise en charge sanitaire par rapport à l'utilisation des pesticides. Les soins et examens médicaux sont laissés à l'initiative et à la charge du producteur. De plus, le personnel de santé dispose de très peu d'informations en rapport avec les pesticides. Sur 42 responsables de centres de santé questionnés, 20 ont répondu qu'ils n'avaient pas de connaissance sur les pesticides. Le faible niveau de connaissance des pesticides se révèle être un grand handicap pour la prise en charge des cas d'intoxication (diagnostic ne faisant pas ressortir le pesticide responsable de l'accident, schéma thérapeutique proposé inadapté au type de pesticide etc.) (Toe, 2010). De ce fait, l'absence de formation spécialisée du corps médical entraîne une prise en charge inadéquate des cas d'intoxication.

Dans l'ensemble, cette enquête a révélé que les producteurs ne respectaient pas les Bonnes Pratiques Agricoles notamment le port d'équipements de protection individuels appropriés. Le matériel de protection (masques à poussière, bottes et gants principalement) est vendu aux producteurs par les distributeurs dans 20 % des cas. Ces équipements ne sont pas spécifiques pour effectuer des traitements.

Les producteurs portent principalement des masques à poussière (39,08 % des cas) suivis des bottes (28,8 %) tandis que les combinaisons sont les moins utilisées (4,5 %) lors de traitements phytosanitaires.

Plus de la moitié des producteurs (67,5 %) possédaient un point d'eau dans leur champ ou à proximité. La majorité des points d'eau est située à une distance inférieure à 100 m des champs. Cette proximité des points d'eau aux champs peut être à l'origine d'une contamination par différentes voies de l'eau par les pesticides. L'eau était consommée dans 50 % des cas, utilisée pour la préparation ou la dilution des pesticides dans 29,26 % et destinée à l'abreuvement des animaux 26,96 % (Toe, 2010).

En définitive, cette étude pilote a montré que les risques de pollution de l'environnement du aux pesticides chimiques tel que le carbosulfan sont importants.

6. Alternatives au carbosulfan

✓ Alternatives chimiques :

Des solutions de substitution à l'utilisation de formulations à base de carbosulfan existent. Comme alternative, les formulations d'insecticide/acaricide sont homologuées et autorisées à la vente dans les pays du CILSS. On retrouve ainsi au moins dix formulations d'insecticide/acaricide dans la liste globale des pesticides homologués par le CSP pour le maïs, la canne à sucre, les cultures maraichères (CSP, 2014). Ces formulations sont à base de chlorpyrifos-

éthyl, de profenofos, de cyperméthrine, de ethoptophos, de abamectine, de deltaméthrine, et de lambda-cyhalothrine.

✓ ***Gestion intégrée de la production et des déprédateurs (GIPD) :***

La gestion intégrée de la production et des déprédateurs, l'expérience GIPD initiée par la FAO en collaboration avec les ministères de l'agriculture de plusieurs pays du Sahel permet d'obtenir des résultats importants dans la production agricole et la gestion des déprédateurs. Cette initiative de bonnes pratiques agricoles (BPA) permet d'améliorer la productivité agricole et de former plusieurs producteurs qui sont de potentiels facilitateurs. La GIPD repose sur les principes suivants :

- Une utilisation raisonnée et judicieuse des pesticides ;
- L'acquisition de connaissances et pratiques nécessaires pour la gestion des déprédateurs ;
- Le renforcement de la capacité des producteurs à la prise de décision au niveau du champ ;
- La conception d'une meilleure productivité à faibles coûts qui protège l'environnement.

Conclusion

Le carbosulfan présente des risques pour la santé des populations et surtout pour les organismes non-cibles de l'environnement, le rendant très difficile à manier sans risque par les utilisateurs des pays du sahel. Ces risques ont justifié son interdiction dans de nombreux pays dans le monde dont tous les pays de l'Union Européenne.

Au niveau des pays du CILSS, le Comité Sahélien des Pesticides a arrêté l'homologation des pesticides à base de carbosulfan depuis 2006 compte tenu de :

- L'écologie fragile des pays du CILSS caractérisée déjà par un déséquilibre des écosystèmes et la disparition d'organismes utiles de l'environnement ;
- Non respect des mesures recommandées pour une utilisation sécurisée du carbosulfan par les utilisateurs dans le contexte des pays du CILSS ;
- Faible taux d'utilisation des équipements de protection par les producteurs ;
- L'existence d'alternatives à l'utilisation du carbosulfan.

Pour porter à la connaissance du public et ce de façon transparente cette décision d'interdiction des pesticides à base de carbosulfan aux fins d'améliorer la santé des populations et préserver l'environnement dans les pays du CILSS, son Ministre Coordonnateur publie la présente note d'interdiction.

COMITE PERMANENT INTER-ETATS DE LUTTE CONTRE LA SECHERESSE DANS LE SAHEL
PERMANENT INTERSTATE COMMITTEE FOR DROUGHT CONTROL IN THE SAHEL

Institut du Sahel

Sahelian Pesticide Committee

Annex to the decision to ban Carbosulfan

1. General information on Carbosulfan

Carbosulfan ($C_{20}H_{32}N_2O_3S$) is a carbamate insecticide used to control locusts and different types of grasshopper (SPC, 2011). It has been introduced by the American FMC corp. (The pesticide manual, 1994).

2. Toxicological data

Carbosulfan belongs to WHO class II (moderately hazardous) (Footprint, 2011 ; WHO, 2008). It is a cholinesterase inhibitor (FAO, 2003).

2.1. Acute toxicity

Carbosulfan is moderately acutely toxic to mammals. Oral LD50 is 101 mg / kg in rats (Footprint PPDB, 2014). LD50 for Carbosulfan was > 2000 mg / kg body weight in rabbits treated by dermal route and LC50 was 0,61 mg / l in rats treated by inhalation (FAO, 2003).

Poisoning signs vary according to the exposition route:

if swallowed, the following can be observed : a lasting cholinesterase inhibition of most tissues, in particular of the central nervous system, of muscles and blood with an acetylcholine accumulation; early onset of gastrointestinal signs and of muscarinic receptors poisoning : nausea, vomiting, digestive pains and diarrhoea, miosis, hyper salivation, defecation, urination, bradycardia, high blood pressure, asthmatic dyspnoea; signs of nicotinic receptors poisoning: fasciculation and muscle cramps, involuntary movements, paralysis of respiratory muscles and tachycardia, HBP, confusion, ataxia, convulsive coma, risk of hemodynamic shock;

if inhaled, the same mechanism of action can be observed as if swallowed ; less marked gastrointestinal signs; very early respiratory symptoms, asthmatic dyspnoea, bronchial hyper secretion; early signs of muscarinic and nicotinic receptors poisoning;

in case of local acute poisoning, skin irritation and good penetration as well as eye irritation with tearing and conjunctivitis.

2.2. Chronic toxicity

✓ ***Carcinogenic effects***

Considering the absence of genotoxicity and carcinogenicity in rats and mice, it has been concluded that Carbosulfan is not likely to represent a carcinogenic risk to humans. (FAO, 2003). According to Footprint PPDB (2014), Carbosulfan is not carcinogenic.

✓ ***Reproductive and development effects***

In a three-generation reproductive toxicity study, Carbosulfan was administered at doses of 10, 20 and 250 ppm. No effects on mating and gestation rate and on the number of viable foetuses have been observed. The weight of offspring, litter size and newborn survival decreased at doses of 250 ppm, as well as the body weight of male and female parents at the same doses. NOAEL in parents was 20 ppm, equivalent to 1,3 mg / kg of body weight per day, based on the reduction of body weight. NOAEL for puppy poisoning was 20 ppm based on the reduction of litter size, offspring body weight and puppies body weight gain. NOAEL for reproductive toxicity was 250 ppm, that is 17 mg / kg of body weight per day, the highest dose (FAO, 2003).

3. Environmental data

✓ ***Behaviour and fate of the pesticide in the environment :***

Carbosulfan is not mobile ($K_{oc} = 9489$ mL/g) (Footprint, 2011). It therefore does not present a risk of surface water pollution by runoff. It is not persistent in the soil ($DT_{50} = 21$ days). Carbosulfan presents a low ground water pollution risk considering GUS which is of 0,89 (Footprint, 2014).

As far as adsorption/desorption are concerned, Carbofuran and Dibutylamine have been compared to DDT and 2,4-D in four soils ranging from fine sand to clay-sandy loamy soils with pH values ranging between 5 and 7. Carbosulfan was more closely linked to each soil type than 2,4-D and Carbofuran, but not as much as DDT. Furthermore, Carbosulfan was degraded into Carbofuran on silt and clay (FAO, 1985).

The same study confirms the results indicating the low Carbosulfan leaching potential. The main metabolite of Carbosulfan is Carbofuran (FAO, 1985).

It has a high octanol/water partition coefficient ($\log P = 7,42$) and a bioaccumulation factor of concern ($BCF = 990$) (Footprint PPDB, 2014).

✓ ***Effects on non-target organisms:***

Carbosulfan is highly toxic to birds (LD_{50} *Anas platyrhynchos* = 10 mg/kg), fish (LC_{50} 96h *Lepomis macrochirus* = 0,015 mg/L), aquatic invertebrates (EC_{50} 48h *Daphnia magna* = 0,0032 mg/L) and bees (LD_{50} 48h = 0,18 µg/bee) (Footprint PPDB, 2014).

4. Registration and use of Carbosulfan

As far the European Union is concerned, Carbosulfan has been excluded from Annex I of Directive 91/414/EEC by decision n° 2007/4/5/EC of 13th June 2007, but it has been resubmitted (Footprint, 2011 ; JO, 2007). It is currently not registered in any of the EU countries (Footprint PPDB, 2014).

It has been banned in France since 13/12/2008 (JO, 2007). It is on the contrary authorized in Australia (APVMA, 2011 ; Footprint PPDB, 2014).

As far as CILSS countries are concerned, four Carbosulfan based formulations had been granted temporary sales authorization (TSA) in 1996 for the first TSA. Two other formulations have been under review since 2005. However, no Carbosulfan based formulation has been registered by the Sahelian Pesticide Committee since 2006 (SPC) (SPC, 2011 ; Toe, 2007).

5. The Burkina Faso case

During a pilot study carried out in Burkina Faso in June 2010, through both retrospective and prospective surveys, 296 poisoning cases during the application of pesticides have been reported; only one Carbosulfan based formulation was involved in one poisoning case: PROCOT 40 WS, a tertiary formulation containing Carbosulfan (250 g/kg), Carbendazim (100 g/kg) and Metalaxyl-M (50 g/kg).

It also came out from that study that no grower is granted medical check-up or healthcare related to the use of pesticides. Medical treatment and exams are left to the initiative of and at the expense of the growers.

Furthermore, healthcare personnel has very little information on pesticides. 20 out of 42 persons in charge of health care centres who had been interviewed had answered that they had no information on pesticides. The low level of knowledge on pesticides is a significant handicap when dealing with poisoning cases. (the diagnosis not identifying the pesticide responsible for the accident, inadequate proposed therapy etc.) (Toe, 2010). Therefore, the absence of specialised training of medical staff leads to inadequate care in case of poisoning.

In the whole, this survey showed that growers did not follow Good Agricultural Practices, in particular the use of appropriate personal protective equipment. Protective equipment (dust masks, boots and gloves in particular) is sold to the growers by distributors in 20% of cases. That equipment is not specific for field treatments. Growers mainly wear dust masks (39,08 % of cases) followed by boots (28,8 %) whereas overalls are the least used (4,5 %) during plant treatment.

More than half of the growers (67,5 %) had a water source in their fields or nearby. The majority of water points were less than 100m from the fields and this proximity may be at the origin of water pollution by pesticides. Water was being drunk in 50% of cases, it was used for the preparation or dilution of pesticides in 29,26 % and used for animal drinking in 26,96 % (Toe, 2010).

To conclude, this pilot study showed that environment pollution risk by chemical pesticides such as Carbosulfan is high.

✓ ***Chemical alternatives:***

Alternatives to the use of Carbosulfan based formulations do exist. As an alternative, there are insecticide/acaricide formulations which are registered and authorized for sale in CILSS countries. There are at least ten insecticide/acaricide formulations in the general list of pesticides registered by SPC for corn, sugar cane, vegetables (SPC, 2014). These are ethylchlorpyrifos, profenofos, cypermethrine, ethoptophos, abamectine, deltamethrine and lambda-cyhalothrine based formulations.

✓ ***Integrated pest and production management (IPPM)***

The experience in IPPM launched by FAO in collaboration with the Ministries of Agriculture in several countries of the Sahel yielded important results in agricultural production and pest management. This initiative of Good Agricultural Practices (GAP) will improve the agricultural productivity and train several growers who are potential facilitators. IPPM is based on the following principles:

- A sound and judicious use of pesticides ;
- The acquisition of knowledge and practical skills critical to pest control ;
- The reinforcement of decision-making capacity of growers at a field level;

- The development of a better low-cost productivity which protects the environment

Conclusion

Carbosulfan presents risks to human health and especially to non-target organisms in the environment, making it very difficult to handle it without risks for users in Sahel countries. These risks have justified its ban in many countries of the world among which all the European Union countries.

The Sahelian Pesticides Committee has stopped the registration of Carbosulfan based pesticides in CILSS countries in 2006 taking into account:

- The fragile ecology of CILSS countries already characterized by an imbalance of ecosystems and the disappearance of organisms useful to the environment;
- Non compliance with recommended measures for a safe use of Carbosulfan by users in the context of CILSS countries;
- The low utilization rate of protective equipment by growers ;
- The existence of alternatives to the use of Carbosulfan.

The Coordinating Ministry of CILSS Countries issues this ban to make public the decision to ban Carbosulfan based pesticides, and this in a transparent way, in order to improve human health and to preserve the environment in these countries.

ACKNOWLEDGEMENTS

This work has been achieved thanks to the technical and financial support of FAO/PIC to whom we extend our sincere gratitude. We also wish to thank the FAO Representation officers in Burkina Faso for their technical and administrative support.

We are extremely grateful to:

- ☞ The highest authorities of the Ministry of Agriculture, Water and Water Resources and their administrative and technical officers for the help and facilities provided for the effective conduct of the study. We wish to thank in particular the Director-General of the Plant Production Directorate, the Director-General of Plant Protection and all the staff for their forthright collaboration;
- ☞ The Designated National Authorities (DNA) of the Rotterdam Convention in Burkina Faso;
- ☞ The Regional and Province Directors of the Ministry of Agriculture, Water and Water Resources for their dedication and availability;
- ☞ The Province and Departments Health Officers as well as all of their staff for their forthright collaboration;
- ☞ The interviewers for their motivation and their dedication during the “survey” phase of the project.
- ☞ All the people met on the survey sites for their warm welcome and their kind collaboration.

We hope that the results obtained meet FAO/PIC expectations and help to reach the expected objectives!

SUMMARY

In order to improve human health and contribute to the protection of the environment, the Rotterdam Convention on the Prior Informed Consent Procedure for Certain Hazardous Chemicals and Pesticides in International Trade supported the conduct of a pilot study on agricultural pesticides poisonings in Burkina Faso which took place in June-July 2010. The study was carried out using retrospective and prospective surveys conducted among different relevant stakeholders, i.e., agricultural producers, pesticide distributors and retailers, as well as health officers, and has provided the following information:

Ninety-seven (97) pesticide distributors and retailers have been identified on 14 survey sites. A total of 153 different pesticide formulations have been identified among the surveyed distributors and retailers. Distributors have various sources of supply;

Six hundred and fifty agricultural producers were surveyed. Among these farmers, 296 poisoning cases resulting from pesticide application operations were recorded. Pesticide formulations containing paraquat (Gramoxone, Calloxone, Gramoquat super, Benaxone) have alone caused 59 incidents, accounting for 20% of the incidents, and those containing cypermethrine + endosulfan have caused 35 poisoning incidents. Overall, the study has shown that farmers did not follow good agricultural practices and especially that they did not wear appropriate personal protective equipment (only 0.31% of farmers use the personal protective equipment recommended);

Forty-two (42) health care centres were visited and a total of 922 poisoning incidents recorded on the basis of symptoms only have been reported. The pesticide formulation implicated in the poisonings and the circumstances under which they occurred have been identified in only 22 cases. Five (5) out of the 22 cases occurred during pesticide applications and the chemicals incriminated were Gramoxone (2 cases), Capt 88 EC (1 case), Conquest 88 (1 case), Procost 40 WS (1 case).

Generally speaking, farmers do not follow good agricultural practices when using pesticides (only about 0.31% of farmworkers use the recommended personal protective equipments) which explains the high incidence of pesticide poisoning and of acute ones as well in a context where the medical care system is precarious and not easily accessible. Appropriate recommendations

intended to foster the safe management of agro-chemicals by the various stakeholders involved have been developed with a view to improving human health and protecting the environment.

Key words: Severely hazardous pesticide formulations, poisoning, safe management.

INTRODUCTION

The agricultural sector is of major importance in the national economy of Burkina Faso. As a matter of fact, it employs 86% of the total population and generates about 40% of the gross domestic product (GDP) (agriculture 25%, livestock 12% and 3% forestries and fisheries) (MAHRH, 2007).

Cultivated land areas, which account for about 3.6 millions hectares, are dominated by cereal crops (about 82%) followed by cash crops (15% - 14% of which are mainly cotton and groundnuts). Vegetable crops including green beans are cultivated on a land area of 700 hectares and account for less than 1% of the cultivated land area.

Disease and animal pests cause major damage in agriculture and can be responsible in some cases for up to 30 % of yield losses. Thus plant protection products are used to eradicate pests affecting crops particularly in the case of intensive cultures such as cash crops, sugarcane, vegetable crops and, to a lesser extent, fruit trees.

In 1997, 2,533 tons of pesticide formulations with a market value of 12,665 billions CFA Francs were estimated to be used in Burkina Faso and that only for the treatment of cotton, vegetables and the consumption of plant protection services (Van Der Valk, Diarra, 2000). The annual growth rate of pesticide consumption has reached 11 %. About 185 commercial brands (more than a hundred active ingredients) are marketed in Burkina Faso, 75 % of which are active ingredients used as insecticides, acaricides or nematicides. Organophosphates and phytretroids account for about 65% of the active ingredients of the various brands which are offered for sale. Pesticides are considered as one of the main factors of rural development at a time when demographic and economic constraints increase the pressure for productivity growth. They help to reduce the damage caused to crops by pests and even to prevent them. However, pesticides constitute a real threat at the following three (3) levels:

- ☞ The effects of pesticides toxicity on agricultural users and professionals in the pest control industry (Toe *et al.*, 2000 ; Toe *et al.*, 2002);
- ☞ The effects of toxicity on consumers related to the presence of toxic residues (Fournier et Bonderef, 1983);
- ☞ The pollution and contamination of the environment (Ramade, 1992; Toe *et al.*, 2004).

Consequently the sound management of pesticides is of critical importance. The sound management of pesticides which aims at ensuring on the one hand, the protection of users and consumers' health and, on the other hand, that of the environment is a major task which requires the involvement and the contribution of all the stakeholders involved in the production,

distribution and use of pesticides. The principle of the safe management of pesticides with a view to improving human health and protecting the environment underlies the work of the present «*Pilot Study on Agricultural Pesticide Poisoning in Burkina Faso*».

I- BACKGROUND AND STUDY RATIONALE

The use of pesticide should be done in accordance with the recommended good agricultural practices (GAP) in order to improve, on the one hand, users' health and that of consumers of agricultural produce which have undergone pest treatment, and on the other hand, to protect the environment.

Several studies and works carried out in Burkina Faso have shown that agricultural producers did not follow good agricultural practices. (Lendres, 1992, Domo, 1996; Toe *et al.*, 1996; Toe *et al.*, 2000; Toe, 2002). As a matter of fact, an analysis of farmers' agricultural practices revealed that recommended pesticide doses, adequate time of treatments and treatment calendars were not taken into account, inappropriate mixture of products was still very common and that precautionary hygienic measures were not being observed during treatments. Careless disposal of left-over pesticides and of empty containers was also found to be very common among workers.

These sad facts clearly indicate that the sound management of pesticide products is far from being implemented and highlight the major risks incurred by users, consumers and those posed to the environment.

To face the problem, the Rotterdam Convention has supported the conduct of a pilot study on pesticide poisoning in Burkina Faso which took place in June-July 2010.

The Rotterdam Convention is an international agreement on environment which promotes shared responsibilities and cooperative efforts among Parties in the international trade in certain hazardous chemicals in order to protect human health and the environment. Under Article 6 of the Convention, any Party that is a developing country or a country with an economy in transition that is experiencing problems caused by a severely hazardous pesticide formulation (SHPF) under the conditions of use in its territory may propose to the Secretariat the inclusion of the formulation in Annex III (List of chemicals subject to the Prior Informed Consent Procedure).

The objective of the present study is to collect data on pesticide poisoning incidents particularly from severely hazardous pesticide formulations in order to help to protect human health and the environment.

II- OBJECTIVES OF THE STUDY

II-1. Overall Objective

The overall objective of the study is to achieve health and environmental improvements.

II-2. Specific Objectives

- ✓ Identify pesticide formulations found in the studied zone and those used by farmers;
- ✓ Identify health and environmental risk factors associated with the use of pesticides in general and specifically on severely hazardous pesticide formulations;
- ✓ Identify health problems caused by the use of pesticides;
- ✓ Generate additional data to support decision-making processes related to the possible ban of certain pesticide formulations in the CILSS countries and the proposal for their inclusion in Annex III of the Rotterdam Convention;
- ✓ Study technical itineraries;
- ✓ Develop and implement good agricultural practices (GAP).

III- MATERIAL AND METHODOLOGY OF THE STUDY

III-1. Study Material

- ✓ Socio-economic data;
- ✓ Cotton, maize (corn), rain-fed lowland rice farms;
- ✓ Agricultural inputs (pesticides);
- ✓ Equipment/machinery used for pesticide application;
- ✓ Personal protective equipment (PPE) used during pesticide applications;
- ✓ Data collection tools.

Support used to collect data consisted in survey and interview factsheets. The factsheets were developed on the basis of the forms established by the Rotterdam Convention Secretariat. We also took into account the format of questionnaires which had been developed and used to conduct similar studies at the national level in Burkina Faso. (Toé *et al*, 2000; Toé *et al*, 2002; Toé *et al*, 2010).

III-2. Context of the study

Field work (surveys and interviews) took place in the agricultural areas of the Hauts-Bassins, the Cascades and the Boucle du Mouhoun. This is the biggest agricultural and cotton producing zone of Burkina Faso and the major user of agricultural pesticides. The Hauts-Bassins cotton production of the 2006/2007 agricultural season reached 329,787 tons and accounted for 43.4% of national production while the Boucle du Mouhoun area had a production of 257,430 tons (i.e. 33.9% of national production), which made of those two regions the major cotton producing zone of Burkina Faso with 77.3% of national production (MED, 2007a, c). Consequently, cotton is the main cash crop of those two regions. According to the results of the National Survey on Household Living Conditions (EBCVM) which was carried out in 2003, cotton was the second source of income for the farmers of the Boucle du Mouhoun. It alone accounted for 67.1% of income of that region (INSD, 2003).

The Hauts-Bassins had a population of 1,389,258 inhabitants in 2006, i.e. 10.6% of the national population with a cereal production of 628,907 tons (i.e. 17.1% of the national production) including 379,769 tons of maize which constituted 43.8% of the national production (MED, 2007c). As with the Boucle du Mouhoun, it had a population of 1,478,392 inhabitants in 2006, or 11.3% of the national population with a cereal production of 693,506 tons (i.e. 18.7% of the national production) including 169,755 tons of maize accounting for 19.6% of the national production (MED, 2007a).

The Cascades area had a population of 430,677 inhabitants in 2006 with a cereal production of 151,434 tons and a cotton production of 71,767 tons in its 2006/2007 agricultural season (MED, 2007b).

Survey sites have been selected on the basis on their agro-climatic characteristics, their geographic situation, the extent of cultivated crops such as cotton, maize and rice on which pesticides are highly used. On the basis of the above-mentioned criteria, the following sites were selected:

Table I: Distribution of survey sites per region

Regions	Provinces	Survey sites	Farming Systems
Hauts-Bassins	Kéné Dougou	Banzon	Rice, cotton, maize,
		Kayan*	Maize, cotton,
		N'Dorola*	Maize, cotton,....
	Houet	Bama	Rice, cotton, maize,...
		Bobo-Dioulasso	Maize, cotton,....
		Faramana*	Maize, cotton,....

III-4- Study methodology

III-4-1. Types of surveys

Part of the study consisted in undertaking restrospective surveys intended to collect epidemiologic data related to pesticide intoxication cases in rural areas. The relatively short time required for that work, the availability of human and financial resources and the opportunity it gave us to record and identify a large number of poisoning cases led us to opt for this type of investigation method. Previous studies conducted on the subject had confirmed the prevalence of intoxication incidents. (Toé *et al*, 2000, Toé *et al*, 2002).

Prospective studies were conducted to monitor agricultural producers during pesticide application operations and to identify weaknesses and strengths of producers' pesticide management (pesticide acquisition, pesticide doses, precautionary measures, safety measures, management of agro-chemical stocks, left-over pesticides and of empty containers).

III-4-2. Sampling method

Fifty (50) farms were selected in each department. In order to take into consideration the different categories of agricultural producers, a stratified sampling based on the size of the farms was created.

Stratified sampling

Based on the size of farms, the following four groups were taken into account:

- Group I. Less than 1,000 m²
- Group II Between 1,000 and 2,500 m²
- Group III Between 2,500 and 5,000 m²
- Group IV More than 2,500 m²

The total number of farms per department and the number of farms of each group was assessed in order to do the sampling. The representativeness of each group in the department was calculated on the basis of the total number of farms per group as per the following:

$$\frac{\text{Number of farms in the group}}{\text{Total number of farms in the department}}$$

To determine the number of farms from each group that should be part of the 50 farms selected for the sampling, we have multiplied 50 by the group coefficient.

All pesticide distributors and retailers located in rural towns were taken into account. With respect to more populated areas (urban zones/towns) retailers were selected according to their geographical situation (market place, city centre).

As for health care service centres they have all been systematically included in the sampling.

III-4-3. Investigation techniques used among interviewees

III-4-3-1. Investigation techniques used among pesticide distributors and retailers

They consisted in carrying out interviews among the persons who were in charge of the trade and distribution of pesticides in wholesale and retail establishments and in having them filling out the questionnaire attached in Annex 1.

III-4-3-2. Investigation techniques used among farmers

They consisted in collecting data on experienced or observed intoxication cases, the identity of incriminated chemicals, the accounts of accidents and on the evaluation of knowledge, attitudes and practices, (KAP) among agricultural producers through the conduct of retrospective surveys with the help of Questionnaire 2.

They also included a prospective study aiming at monitoring farmers during pesticide applications in the fields.

III-4-3-3. Investigation techniques used among health care centres

Surveys aimed at recording poisoning incidents together with their description were carried out at health centres' level. The investigations were designed to collect reliable and well-documented data along with biological tests results, when available.

III-4-4. Information research

The first step was to identify the political, institutional and legal frame related to the use and trade of pesticides. The second step consisted in determining the number of farms and farmers per site, in drawing a list of the existing health care centers and finding about their

vicinity to community groups and finally in compiling data on recorded pesticide formulations and their active ingredients (toxicologic and ecotoxicologic data, registration status, regulations).

III-4-5. Field work

III-4-5-1. Field work preparation

Semi-structured and structured interviews were conducted among resource persons at the Bobo-Dioulasso Cotton Programme and among the Agriculture technical and administrative regional officers. The interviews were designed to collect information to be used to identify survey target sites. (Table I). Sites have been selected taking into account:

- The importance and the nature of commercial crops, (cotton, maize (corn) or rice) which, because of the extent of cultivated areas and permanent threats from pests, require the excessive use of pesticides;

- The geographic situation of the sites to take into consideration uncontrolled and illegal entries of pesticides through land boundaries (Mali, Ivory Coast).

To finalize the questionnaires, a few producers and pesticide retail dealers were interviewed in order to rewrite questions which did not seem to be clear enough at the time of the preliminary surveys.

Once the final version of questionnaires was adopted, a training session aimed at interviewers was organized in order to optimize their survey technique tools and knowledge (sampling, interview techniques, and to give them a better understanding of the objectives of the study (See Training Workshop Report, May, 2010).

III-4-5-2. Field study progress

Each survey interviewer had contacted the relevant administrative and technical services at her/his town/village level (Headquarters (prefectures), townhalls, Technical Support Units (TAU), to collect preliminary data on the number of farms and their different categories.

On the basis of the data obtained, a random sampling was done to identify persons to be surveyed and the latter were subsequently asked to answer the questionnaire attached in Annex 2. As most of the farmers were busy during the day, surveys were conducted early in the morning, in the evening or in the fields during the day.

Interviews were carried out among the persons in charge of pest control products in the distribution, storage and retail premises to obtain information on pesticide management with the help of the questionnaire in Annex 2.

Following the questionnaire presented in Annex 3, interviews were conducted among health agents to record and describe poisoning incidents caused by pesticides, with special focus on incidents which occurred in the fields during pesticide treatment operations.

III-4-6. Data processing and analysis

After the perusal of survey sheets, data was codified, entered and analysed using the data management software Epi Info 3.3.2 and Excel 2007 software. Results were summarized into descriptive statistics and depicted in graphs summarizing the frequency distribution and average and standard deviation distribution.

The identification of active ingredients together with their concentration, chemical family and hazard class under WHO classification of the recorded pesticide formulations was made with the help of the CPS list of registered pesticides, the PIP Toolkit, the Footprint PPDB database and the ACTA Phytopathologica Journals.

III-4-7. Final report

The final report was written, printed and forwarded to DNA/CNGP and to FAO/PIC for clearance.

III-5. Expected results

- ✓ Technical itineraries will be analysed;
- ✓ Agricultural pesticide formulations used in Burkina Faso will be identified and listed;
- ✓ Health and environmental risk factors related to the use of pesticide and specifically to severely hazardous pesticide formulations will be identified;
- ✓ Health problems associated with the use of pesticides in general and specifically to severely hazardous pesticide formulations will be recorded;
- ✓ Proposals for the inclusion of severely hazardous pesticide formulations listed in Annex III of the Rotterdam Convention will be forwarded;
- ✓ Additional data to support decision-making processes related to the possible ban of certain pesticide formulations in CILSS countries will be collected.

IV- OUTCOME OF THE STUDY AND DISCUSSIONS

IV-1. The use and trade of pesticides and the political, institutional and legal framework

In order to support sustainable development and food security, Burkina Faso has introduced, among others, new legislation and national regulations to strengthen the implementation of sound pesticide management. In doing so, Burkina Faso reiterates its commitment to the international and regional agreements signed under the Basel Convention, the Rotterdam Convention, the Stockholm Convention, the International Code of Conduct on the Distribution of Pesticides, and the Common Regulations for Pesticide Registration scheme in CILSS countries.

The Government has promulgated a series of laws to address the sound management of pesticides and has made provisions for their effective enforcement. They provide for the control and safe storage of pesticides and involve the following three (3) ministerial departments:

☞ Ministry of Agriculture, Water and Water Resources (MAHRH)

Under the Common Regulations for Pesticide Registration in CILSS Countries, Burkina Faso is not entitled to have its own independent pesticide registration body. Pesticide registrations are carried out by the Sahelian Pesticide Committee (SPC). The common regulation applies to pesticides and bio-pesticides. Burkina Faso entered CILSS Common Regulations for Pesticide Registration scheme in 1992. A National Commission on the Control of Pesticides (CNCP) was subsequently created in August 2000 to implement regulatory actions taken by the Sahelian Pesticide Committee.

Under Article 23 of the regulation, the following two Acts together with provisions for their enforcement have been enacted:

- ☞ Law N°041/96/ADP, of 8 November 1996 on Pesticide Control in Burkina Faso;
- ☞ Law N°006-98/AN, of 26 March 1998 – amendment to Law N°041/96/ADP of 8 November 1996 on Pesticide Control in Burkina Faso;
- ☞ Decree N°98-472/PRES/PM/AGRI, of 20 December 1998 on the establishment of the National Commission on the Control of Pesticides (CNCP), its composition and operational procedures;

IV-2. Results of the survey carried out among pesticide distributors

IV-2-1 Pesticide distributors characteristics

Ninety-seven (97) pesticide suppliers distributed in 14 different sites were identified during the study. Figure 1 shows the distribution of pesticide suppliers in the different sites of the study.

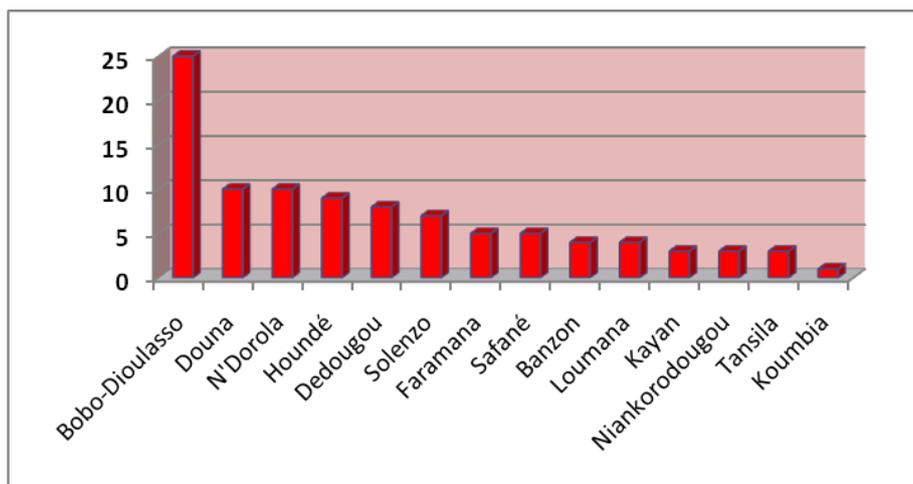

Figure 1: Distribution of pesticide suppliers in the surveyed sites

As shown in Figure 1, twenty-five (25) out of 97 pesticide distributors are found to be located in the town of Bobo-Dioulasso, i.e. 25.77% them which is explained by the fact that Bobo-Dioulasso is the second most important town of the country and its main economic centre. Among the surveyed pesticide distributors, companies such as SAPHYTO and SCAB stand out as the major and more organized pesticide distribution establishments.

IV-2-2. Main pesticides recorded

One hundred and fifty-three (153) pest control products out of which 49 (i.e. 32 %) have been authorized for sale by the Sahelian Pesticide Committee, were recorded during the survey and 56 active ingredients were identified among the 97 distributors of the 14 survey sites. The main categories of pesticides found are herbicides, insecticides and fungicides. The complete list of recorded chemicals is provided in Annex 6 and the list of active ingredients is given in Annex 4.

Out of the 56 active ingredients which were recorded, thirty (30) are included in the Annex 1 of the European Union and hence are authorized in the European Union countries, eight (8) of them have been resubmitted for consideration and three (3) are banned. The other 15 active ingredients which are not listed in Annex 1, include, among others, paraquat, carbofuran, endosulfan, lindane and profenofos and are found in some of the pesticide formulations under Class Ib and II of the WHO hazard classification.

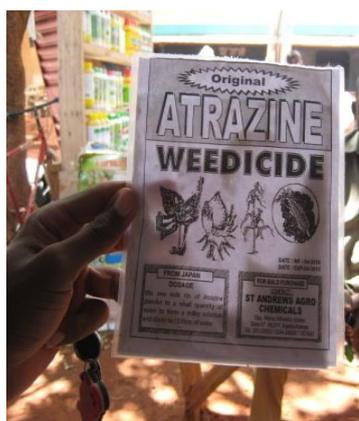

IV-2-3. Main sources of supply

National wholesale companies such as SCAB, DTE, SAPHYTO (the only pesticide manufacturer), SOFITEX Company, cooperatives, the National Union of Burkina Faso Cotton

Producers (UNPCB), constitute the main sources of supply of pesticides to agricultural producers.

Eighty-five percent (85%) of the distributors and retail dealers know about other sources of supply. Ghana, Ivory Coast, Mali, Nigeria and China are by order of importance the major suppliers.

It is common to find inappropriate packaging in registered retailers such as labels containing instructions in English. These products usually come from Ghana and Nigeria.

1)

2)

3)

Photos 1, 2 and 3: Chemicals coming from Ghana and found on the market

According to retail vendors, the practice of selling non-registered chemicals and authorized ones (i.e. registered by the Sahelian Pesticide Committee) is due to high competitiveness on the market.

Retail vendors from the area Solenzo have said that the reason why most pesticides come from Ghana, Mali and Ivory Coast is due to the fact that products sold by SAPHYTO are far too expensive.

Photo 4: Formulation containing Paraquat

Photos 5 and 6: Formulations containing atrazine

IV-2-4. Pesticide management

Management of left-over products

About 10% of distributors have reported receiving left-over pesticides from their customers. In 78 % of cases they are unused pesticides which are still in sealed containers and not obsolete, so they offered for re-sale. However, generally speaking, the probability of finding obsolete chemicals is extremely high.

Storage of agro-chemicals

Thirty-seven percent (37%) of the surveyed distributors have a warehouse. In half of the cases, pesticide storage facilities are considered to be appropriate. Adequate storage facilities are found mainly within the largest and most organized establishments such as SOFTTEX and SHAPHYTO. In some rural towns (Tansila for example), it has been found that pesticide street vendors store their products in their sleeping rooms.

Orderly storage accounts for 64% of the surveyed cases and non orderly storage accounts for 36% of the remaining ones.

7)

8)

9)

Photos 7, 8 and 9: Storage of pesticides at some vendors' places: 7) Pesticides and goods for sale, 8)

Unsegregated Products, 9) Chemicals stored on shelves

Thirty percent (30%) of the surveyed premises had trained warehouse keepers and in 51% of cases, they used storage data sheets. Seventy-nine percent (79%) of the surveyed retailers and distributors were not using safety data sheets.

Photo 10: Example of a storage data sheet from a pesticide vendor

Stock management is carried out as follows: compliance with initial packaging or repackaging. It has been noted that most retail dealers (91%) keep the products in their original containers. Repackaging is done mainly in large pesticide distribution establishments (SCAB, SAPHYTO). Figure 2 shows the distribution of pesticide distributors and retailers according to their stock management practices.

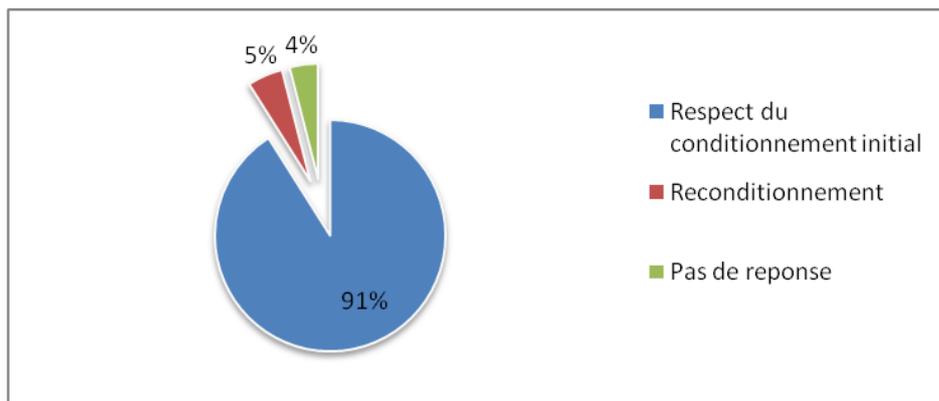

Figure 2: Stock management practices followed by pesticide distributors and retailers

(Text in the table)

Comply with initial packaging

Repackaging

No answer

Availability of First-Aid-Kit

Only 14% of the surveyed premises have a First-Aid-Kit. Products found in the First-Aid-Kits include alcohol, vegetable charcoal, amoxicillin, paracetamol, atropine, *Aloe vera*, soap, ibuprofen, quinine, efferalgan, pre-cut adhesive strip dressings, active charcoal, gloves, masks, mercurochrome.

Only the main wholesale companies (SCAB, SAPHYTO) have well-equipped First-Aid Kits.

Management of empty containers

In 32% of cases, premises have reported treating their empty containers. The different container management practices and the occurrence of such practices are summarized in Figure 3 hereunder.

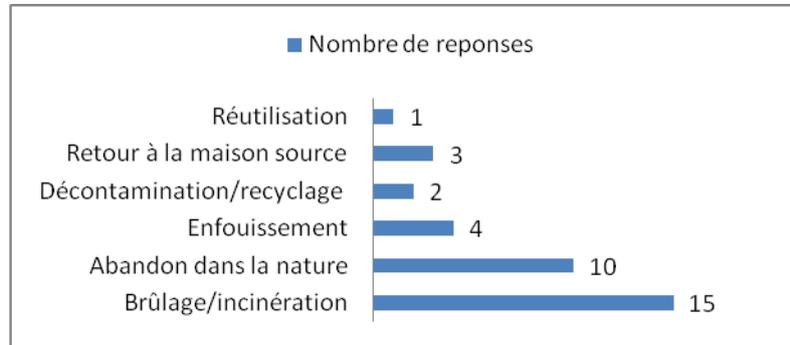

Figure3: Management of empty containers by pesticide distributors
(Text in Table)

Re-use/Return to the original supplier/Decontamination/recycling/Burying/Dumping into the environment/Burning/incineration

Structures such as SOFTTEX store their empty containers and return them to the main pesticide supplier in Bobo.

Photo 11: Empty container abandoned into nature

Photo 12: Containers stored with goods

Results of the study carried out on empty containers management indicate that, in most cases, pesticide containers are being re-used. Some companies such as SOFTTEX return empty containers to their main pesticide suppliers which contribute to reducing risks associated with those chemicals. Other licensed premises such as SPAPHYTO have their decontamination and recycling facilities onsite and are able to treat their own pesticide wastes.

Careless practices such as re-using empty pesticide containers, dumping them into nature or burning them constitute major risks to human and animal health and the environment.

IV-2-5 Risk prevention and protection measures for farmers

Ninety-two percent (92%) of the surveyed distributors have reported to be aware of risks associated with the use and handling of pesticides.

Three quarters (3/4) of the distributors provide their customers with information related to the proper use of pesticides.

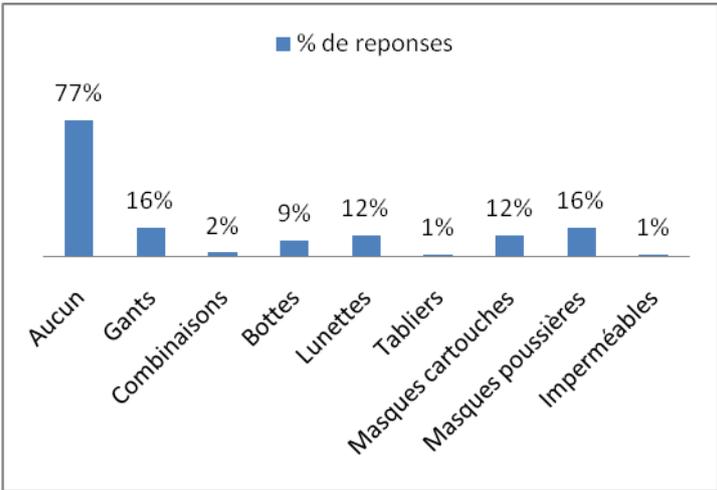

Training sessions on the appropriate use of pesticides aimed at farmers are being organised by the major pesticide distributors. In 16% of cases, training courses are organized by companies themselves with a frequency of once a year in 10 % of cases, and of twice a year in 4% of cases. Training sessions are free in 14% of cases.

Training sessions provided to farmers and distributors usually take place at the beginning of each agricultural season. SOFITEX organises two training sessions per season.

Personal Protective Equipment

In 20 % of cases, pesticide distributors provide PPE to farmers. Main protection gear includes gloves (16%) and dust masks (16%). Overalls are provided in 2% of cases.

Figure 4 shows the different types of personal protective equipments provided to farmers

Text in Table

(None, Gloves, Overalls, Boots, Glasses, Aprons, Cartridge masks, Dust masks, Raincoats)

Figure 4: Personal protective equipments provided to farmers by pesticide vendors

Some establishments do not sell personal protective equipments but have equipped operators to do pesticide treatments for farmers on request. Other places provide gloves or dust masks for free but payment is required for the use of other personal protective gear.

Findings of the survey carried out among distributors

Informal trade accounts for most of pesticide distribution and trade activities and a few private professional establishments are licensed to sell pesticides. Most of the trade activities carried out by distributors and retailers are uncontrolled and illegal and contribute to increasing risks posed to farmers, communities and the vendors themselves who are not aware of the hazards associated with the products they handle all day long.

Most of the products sold are pesticide formulations in the form of emulsifiable concentrates (EC) or active ingredients belonging to chemical families which have been banned under international agreements or subject to restrictions. They are:

- ✓ Lindane which is included in Annex III of the Rotterdam Convention (chemicals subject to the PIC Procedure), in the LRTAP List and the PAN Dirty Dozen List from PAN UK (List of list, 2009);
- ✓ Paraquat which is included in the PAN Dirty Dozen List of PAN UK (List of list, 2009) and was found in (6) of the recorded pesticide formulations.

Similarly, pesticide formulations containing active ingredients such as atrazine and paraquat, and banned by the CPS are being found in local market places and sold to farmers. Those pesticide formulations have severe adverse effects on users' health (acute intoxication risks related to the use of paraquat) and on the environment (water contamination risks related to the use of atrazine which is present in 26 of the recorded formulations).

Some banned pesticide formulations containing active ingredients such as endosulfan (ROCKY 386 EC) were not recorded among retail dealers but were found to be commonly used by cotton producers. This can be due to the fact that some vendors managed to hide certain products when they saw interviewers coming or that some farmers rely on sources of supply other than those which have been recorded especially when they are living close to neighbouring countries.

Major concerns related to pesticide management in the private sector can be summarized as follows:

- non-compliance with regulation with respect to the distribution of pesticides by registered vendors;
- lack of knowledge and training of pesticide distributors and vendors who are unable to provide proper advice to their customers;

- lack of knowledge of vendors and customers on pesticide toxicity: pesticides and food commodities are sold in the same shops;
- huge transboundary trade of illegal and banned chemicals.

IV-3- Results of the survey carried out among farmers

IV-3-1 Socio-demographic characteristics of the surveyed farmers

In total, 650 farmers distributed in 16 towns and 6 provinces of the three (3) studied regions were surveyed.

IV-3-1-1. Sex and age of farmers

In the studied zone, pesticide application was found to be predominantly a male activity. In fact, 98.3% of the surveyed persons involved in the application of pesticides were men. Only 1.7% of the applicators were women.

Table II shows the age distribution of farmers

Table II: Age distribution of farmers

Age category (years)	10 – 20	20 - 30	30 – 40	40 - 50	50 – 60	60 – 70	70 - 80	Total
Number	11	125	224	191	80	18	1	650
Percentage	1.7	19.2	34.5	29.4	12.3	2.8	0.2	100

The average age of farmers is 39.58 ± 10.30 years. The youngest person involved in pesticide application operations is 17 years old as the oldest one is 75. Results given in the table indicate that activities related to pesticide applications involved individuals of different age categories. Even though the majority of workers involved are less than 60, some of the operators are over 60 (3%). This raises some concern as it is known that the functional capacity of human vital organs such as kidneys decrease with age. Consequently, it contributes to increasing health risks related to the exposure of pesticides as the elimination of xenobiotics from the human body diminishes considerably in elderly people. Besides, age can be a factor that fosters the recourse to pesticides in that older people seem to have a tendency to use herbicides to eradicate weeds rather than pulling them by hand.

IV-3-1-2. Educational level among farmers

60.5% of the surveyed population had no education at all, 31.8% of them had gone through primary education and 7.7% had a secondary education level. Overall the level of education of surveyed farmers is low. Illiterate farmers cannot read labels and follow recommended instructions for the proper use of pesticides. This fact does hinder the implementation of a scheme aimed at reducing health risks. However, farmers who have acquired literacy in the indigenous language can constitute an asset for the community. As a matter of fact, training programmes on the management and proper use of pesticides can be designed and provided in the local language. Such programmes could initially target a restricted number of individuals who will eventually be requested to take over training among the other members of the community.

IV-3-1-3. Farmers' extent of experience in the use and handling of pesticides

The results of the study indicating the extent of farmers' experience in handling pesticides are reported in Table III.

Table III: Distribution of farmers according to their experience in pesticide use

Age category (years)	0 -10	10 - 20	20 - 30	30 - 40	40 -50	Total
Number	250	237	113	36	5	641
Percentage	39%	37%	17.6%	5.6%	0.8%	100%

The study has shown that the extent of farmers' experience related to the use of pesticides can vary considerably. Some workers had a short experience of two years in applying pesticides while others have been doing this work for more than fifty years. However, contrary to the idea that experience can be an asset, we have been able to see directly from the fields that pesticide operators with the longest experience did not necessarily give the best example. As a matter of fact, they were applying pesticides without personal protective equipments on the pretence that they did not feel there were any risks in handling pesticides.

IV-3-2. Use and safe management of pesticides by farmers

IV-3-2-1. Pesticide treatment equipment

The study shows that the equipment used were mainly backpack sprayers with a volume capacity of 10 to 20 L (in 96 % of cases) and Ultra Low Volume sprayers (ULV) or Ultra Bas Volume (UBV) sprayers with a volume capacity ranging from 1 to 5 L (4 % of cases).

IV-3-2-2. Management of left-over pesticides after treatment

Figure 5 shows the distribution of farmers according to their management practices with respect to left-over pesticides after treatment operations in the fields

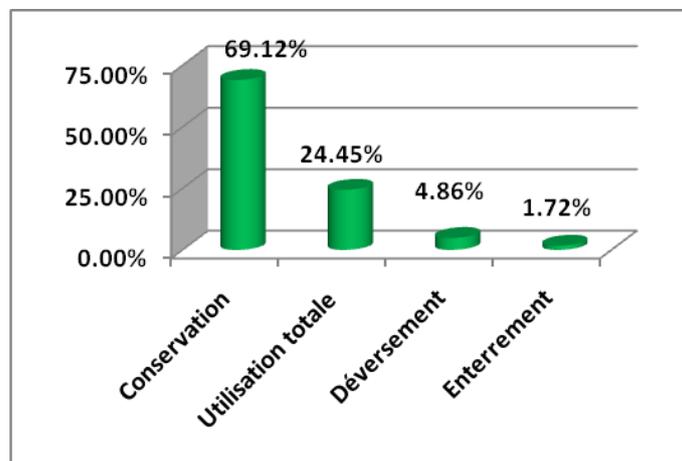

Figure 5: Management practices of left-over pesticides by farmers

24.45% of farmers reported not having any left-over pesticides as they knew the exact quantities required for treatment. Most of the surveyed farmworkers (69.12%) keep their unused pesticides for further applications. They stored them at their place or in the fields. A few of them have declared dumping them into nature (4.86%) or burying them (1.72%). The conclusion drawn on pesticide management practices among farmers is that the careless habit of storing pesticides at home severely exposes family members to risks in terms of health while discharging them into the environment or burying them inevitably leads to environmental contamination.

IV-3-2-3. Management of empty pesticide containers after use

Figure 6 shows the distribution of farmers according to the answer they gave on empty pesticide containers management.

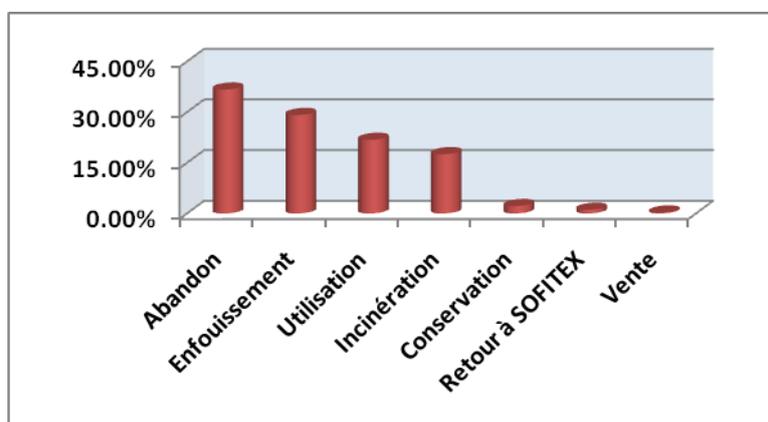

Figure 6: Farmers' management of empty containers

A certain number of farmers (36.68%) abandon empty containers into the environment as they are or after destroying them and leave them either in their fields or place them into holes or lower areas, thus increasing the risk of environmental contamination. In 21.79% of cases, empty packaging was re-used. Re-using empty containers contributes to increasing health risks as pesticide residues cannot be completely eliminated by simply rinsing containers.

IV-3-2-4. Use of protective gear

Figure 6 summarizes the distribution of the different types of personal protective equipment worn by farmers and the frequency with which they are used.

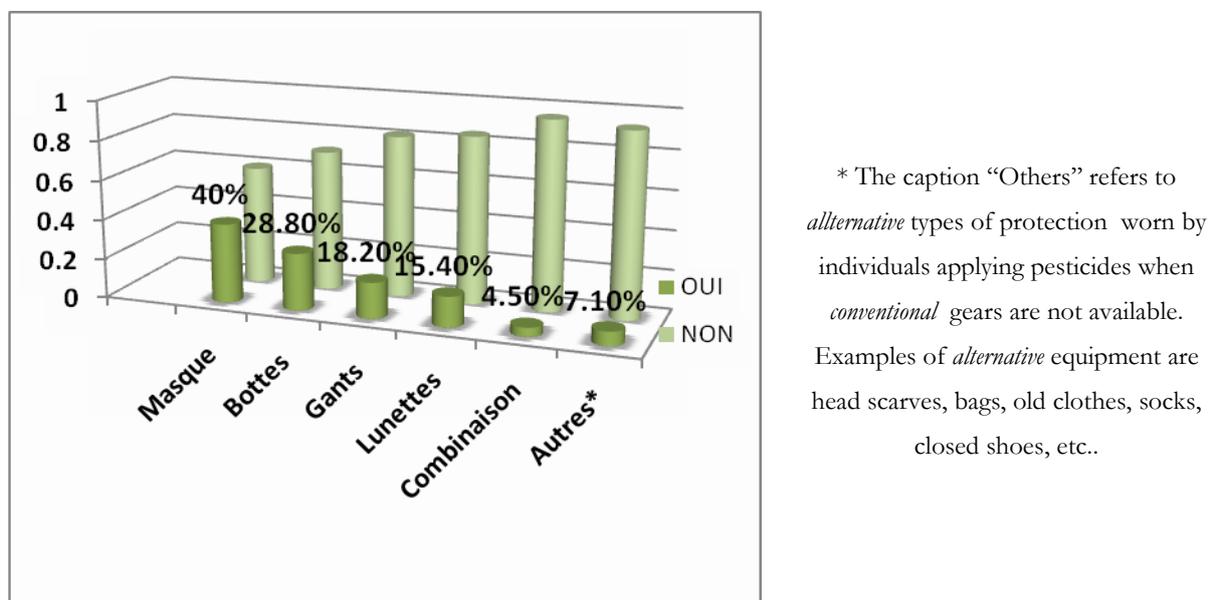

Figure 6: PPE worn by the surveyed persons involved in the application of pesticides

Text in Table

(Masks, Boots, Gloves, Glasses, Overalls, Others)

Figure 6 shows that of the protective gear most widely worn by farmers, masks are the most used (40% of farmers use them, 39% of which are dust masks against 1% are masks cartridge filters), followed by boots (28.8%), with the combination of the two are the least used (4.5%). It stands out that protection is usually incomplete as confirmed in Figure 7 which outlines the different set of personal protective gear worn by farmers during pesticide applications. Very few farmers have full protection.

Figure 7 shows that 12.62 % of farmers wear both masks and boots, while only 0.93% wears gloves, boots, overall, mask and glasses at the same time. Masks with filter cartridges are worn in combination with gloves, boots, coveralls and goggles in only 0.31% of cases. The scarce use of personal protective equipment and the tendency to have only partial protection inevitably leads to high exposure risks among pesticide applicators.

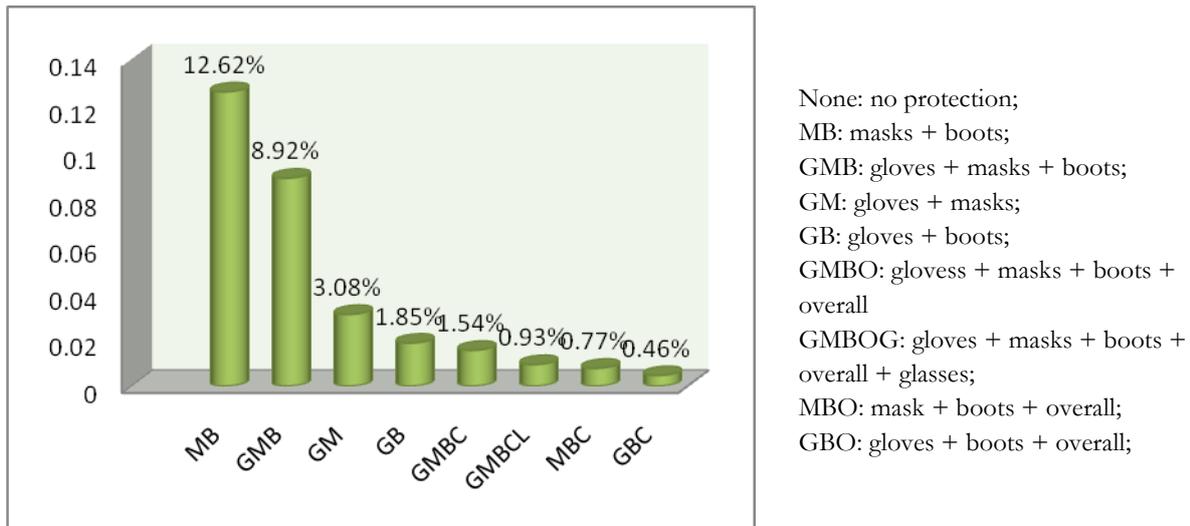

Figure 7: Combination of protective gears worn by surveyed persons involved in the application of pesticides

Surveyed persons were asked to explain why they did not use PPE and their comments were the following:

- Have no financial means to buy PPE;
- PPE are too expensive and not affordable on a farmers' budget;
- Do not know about their existence;
- Are expecting PPE to be provided for free;
- Unavailability of such equipments in the market place;
- PPE are not adapted to local weather conditions. For instance, some farmers said they feel discomfort and that they could not breathe properly while wearing PPE during spraying activity;
- Do not think of pesticide hazards

Intoxication risks to which applicators are exposed depends partly on the conditions in which pesticides are used and especially on the use made of personal protective equipment. If it is

accepted that to ensure proper applicator protection should be joint use of suitable gloves, boots, coveralls, masks with cartridge filters and goggles, it appears that only 0.31% of farmers are entitled to this recommended protection. The majority of those who considered themselves to be protected during applications, that is to say 12.62% of the surveyed persons use only masks and boots.

Another sad fact which adds to the already low level of protection among farmers is that they usually wear inadequate and poor protective equipment. Alternatives to the use of conventional protective equipment are found to be very basic and consisting in using latex gloves or simple plastic bags instead of rubber gloves, old and torn clothes instead of overalls, socks instead or boots. Those substitutes cannot ensure the safe handling of pesticides and contribute to higher risks of exposure among applicators.

13)

14)

Photos 13 and 14: Farmers' protection during pesticide application

IV-3-2-5. Perception of health risks among farmers

Most of the farmers with whom we talked reported to be aware of the adverse effects of pesticides on their health and that of others. When asked what types of risks they were exposed to when using pesticides, the following responses were given:

- ✚ Pesticides can cause human poisoning;
- ✚ Can cause headaches, stomach pain;
- ✚ Can cause skin diseases;
- ✚ Can cause pain in the eyes;
- ✚ Can cause a cold;
- ✚ Can kill animals;

- ✚ Can make people sick;
- ✚ Can kill;
- ✚ etc.

IV-3-2-6. Perception and factors of environmental risks among farmers

Contamination risks of watering places according to their distance from agricultural fields

The majority of farmers (67.5%) have reported having a watering place in their fields or in the vicinity. As shown in Figure 9, 12.41% of watering places are found in the fields and a large number of them are situated at less than a hundred metres from the fields. The vicinity of watering sources to fields increases the risks of water contamination by pesticides released through different mediums.

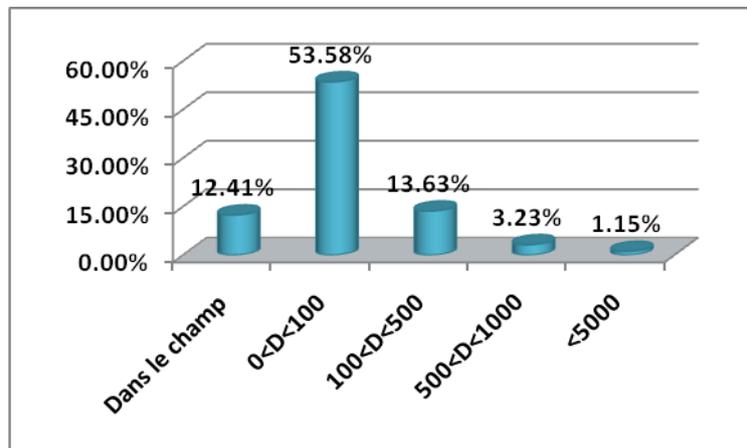

Figure 8: Distance between watering places and fields

(Text in the Table)

In the field

Risks associated with the use of water from watering sources

Uses made of water from watering sources are shown in Figure 9. It has been observed that in 50% of the watering places, water was used for consumption, in 29.26% of them it was used to mix or dilute pesticides and 26.96% of these structures were used to provide water for animals.

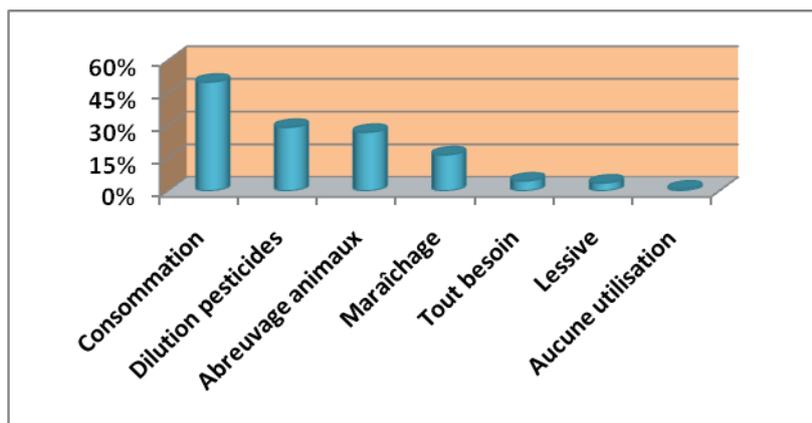

Figure 9: Uses of watering places

(Text in the table)

Consumption/Dilution of pesticides/Watering sources for animals/Horticulture/Any use/Washing/No use

Facts on the Loss of biodiversity

Surveyed farmers have observed that there is a correlation between pesticide treatments and the decline in numbers of various species: farmyard animals, birds, aquatic animals, land vertebrates and invertebrates etc.

IV-3-3. Toxicity of pesticides used by farmers

IV-3-3-1. Identification of pesticides used by farmers

The table of Annex 7 lists all of the pesticides together with their active ingredient(s) that surveyed farmers have reported having resorted to in the agricultural sector. A total of 78 products have been reported to be used. Information such as the WHO toxicity classification of chemicals as well as the regulatory status of the products under the Sahelian Pesticide Committee (CSP) is also included. Out of these products, 33 pesticide formulations (42.31 %) have been authorized for sale by the CSP.

IV-3-3-2. Pesticide Toxicity

Health damages caused by xenobiotics in general and pesticides in particular are linked to their toxic potential. Pesticides used by farmers are divided into different hazard classes under the WHO classification:

The WHO Classification of Pesticides by Hazard

	LD50 acute (mg/kg body weight)	
--	--------------------------------	--

	Rat			
Class and correspondence	ORAL		DERMAL	
	Solid	Liquid	Solid	Liquid
Ia - Extremely hazardous Very toxic	< 5	< 20	< 10	420
Ib -Highly hazardous Toxic	5-50	20-200	10-100	40-400
II - Moderately hazardous Harmful	50-500	200-2000	100-1000	400-4000
III - Slightly hazardous Handle with care	>500	> 2000	>100	> 4000
IV - Unlikely to present acute hazard in normal use				

Restricted Use Pesticide Classification

	Can be used by
Ia - Extremely hazardous Very toxic	Only licensed applicators
Ib -Highly hazardous Toxic	Certified and experienced applicators under close supervision
II - Moderately hazardous	Experienced applicators under close supervision who strictly follow precautionary measures
III - Slightly hazardous	Experienced applicators complying with routine safety requirements

Two of the pesticides used fall under Class Ib of the WHO Classification. Pesticides falling into that category are highly hazardous and can be used only by certified and trained applicators and under close supervision. The use of such products should be strictly forbidden to farmers who have no training, who do not have appropriate personal protective equipment and who tend to underestimate pesticide-related hazards.

Seventeen pesticides fall under Class II. They are considered as moderately hazardous and their use is restricted to trained applicators under close supervision who strictly comply with recommended precautionary measures. The population studied during our survey with its limited level of education, lack of training and the general tendency not to comply with safety requirements in terms of protective equipment should in no way use this category of pesticides.

It has been noted that most of the pesticides used fall under class III (26 out of 78). They are rated as slightly hazardous and can be used by trained applicators who comply with recommended precautionary measures. Well-trained farmers who would comply with

recommended patterns of use and safety requirements should be able to handle these products with no major risk of intoxication.

Seven of the pesticides used by farm-workers belong to class U and are unlikely to present acute hazards under normal use. Complying both with restrictions of use and precautionary measures is a way for pesticide applicators to ensure their safety.

IV-3-3-3. Major sources of supply

Local markets have been reported to be the first source of supply for pesticides to farmers. Moreover, SOFITEX, which is a state-owned company supporting cotton producers, provides its customers with agricultural inputs including pesticides. Cotton producers are generally organized into cooperatives under the National Union of Cotton Producers in Burkina Faso (UNBCP) which ensures the supply of inputs to its members. As a matter of fact, the UNPCB delivers pesticides to its farmers. Other sources of supply have been mentioned as well and include SAPHYTO, Chinese bilateral aid and FAO. Some farmers located in the vicinity of neighbouring countries (Area of Tansili) have reported getting their supplies from Mali or Ivory Coast, which is evidence of the illegal and uncontrolled trade in the region.

IV-4. Health effects associated with the use and management of pesticides

III-4-1. Types of ailments affecting farmers during and after the use of pesticides

Figure 10 shows the distribution of the different types of ailments affecting farmers and their rate of prevalence

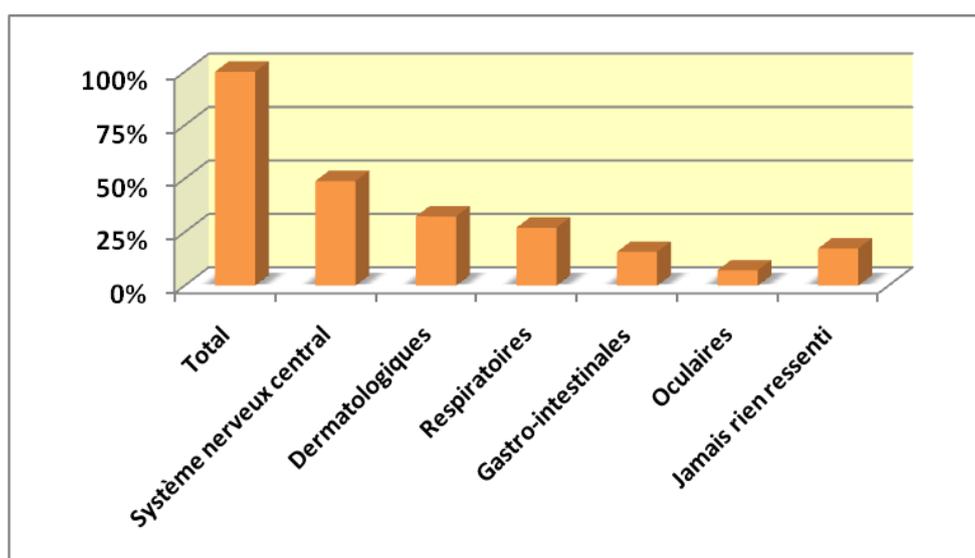

Figure 10: Distribution of farmers according to the type of ailments

Text in the Table

Total/Central nervous system CNS/Dermal affections/respiratory affections/Gastrointestinal affections/Ocular affections/no symptoms

Figure 10 indicate that the majority of surveyed farmers (82.66%) report having experienced, at least on one occasion, a feeling of ill-health during or just after pesticide applications while 17.34% of them have never felt anything. Major types of ailments reported during interviews with farmers are, by decreasing order of importance, those affecting the central nervous system (experienced by 48.92% of farmers), dermal affections (32.35%), respiratory affections (27.09%), gastrointestinal affections (15.79%) and ocular affections (7.12%). It has been noted that the disturbance to the central nervous system is prevalent. As a matter of fact, exposure to insecticides is known to have severe adverse effects on the nervous system.

Table IV lists the main symptoms associated with the different types of ailments

Table IV: Distribution of symptoms associated with the different types of ailments

Ailments	CNS	Dermal	Respiratory	Gastrointestinal	Ocular	Other sign
Signs	Vertigo	Itching	Cold	Abdominal pain	Blurred vision	Palpitations
	Cephalea	Smarting	Cough	Diarrhea	Smarting	Sweating
	Fever	Skin irritation	Respiratory problems	Vomiting	Tearing	Heart rhythm problems
	Drowsiness/ Insomnia	Skin burn	Chest constriction	-	-	Tremor

IV-4-2. Intoxication cases reported by surveyed farmers

A total of 296 intoxication cases were reported among the surveyed farmers. In general, poisonings were accompanied by dermal affections (itching, smarting, skin burns, skin troubles, scars, full lesion of the contaminated area), respiratory ailments (smarting, burning and itching of the respiratory tract, respiratory problems and cough), ocular affections (burning sensation in the conjunctiva, blurred vision, smarting, burning sensation in the eyes, sight loss), gastrointestinal affections (abdominal pain, nausea, vomiting), cephalaea and vertigo. In some cases, the intoxicated person lost consciousness. Table V provides the distribution of reported intoxication cases among pesticide applicators together with the main symptoms experienced.

Table V: Summary of intoxication incidents recorded among farmers 1/6

Chemicals	Pesticide Category	WHO Classification	CSP Registration	Type of incident	Number of cases	Intoxication Symptoms	Total number of Incidents
GRAMOXONE (paraquat 200 g/l)	Herbicide	II	No	Dermal	38	Itching, irritation, skin burns, skin rash, scars, complete lesion of the contaminated area, fever, sweating, dizziness, headaches, bone pain, faintings	54
				Inhalation	08	Irritation, itching, burns, respiratory problems, cough, headaches, vomiting, fever, blurred vision, eye pain, buzzing ears	
				Ocular	05	Conjunctiva burns, blurred vision, irritation and eye burns, headaches, scars	
				Ingestion	03	Abdominal pains, nausea, vomiting, jaw paralysis	
ROCKY 386 EC (cypermethrine 36 g/l + endosulfan 350 g/l)	Insecticide	II	No	Dermal	16	Itching, irritation, burns, abdominal pains, dizziness, headaches, vomiting, cold, fever, shivering, dizziness, fainting, tiredness, skin rash	35
				Inhalation	10	Headache, vomiting, fainting, respiratory problems, burns, cold, abdominal pain, diarrhea, eye pain	
				Ocular	06	Burns, itching, smarting eye, tearing, ocular irritation, eye pain, headaches	
				Ingestion	03	Abdominal pains, vomiting, restlessness, aggressivity, confusional state	
CONQUEST 176 EC (cypermethrine 144 g/l + acetamipride 32 g/l)	Insecticide	II	Yes	Dermal	09	Burns, irritation, itching, shivering, restlessness, cold, persistent dizziness	22
				Inhalation	06	Shivering, vomiting, tiredness, dizziness, fainting, cold	
				Eye	04	Tearing, eye pain, smarting eye, eyeball acute pain	
				Ingestion	03	Abdominal pain, diarrhea, vomiting, delirium	
CAPT FORTE 184 WG (lambda-cyhalothrin 120 g/l + acetamipride 64 g/l)	Insecticide	II	Yes	Dermal	09	Itching, skin burns, headache	21
				Inhalation	09	Headache, buzzing, dizziness, fever, abdominal pain, vomiting, itching, fainting, diarrhea	
				Ocular	01	Blurred vision, redness	
				Ingestion	02	Headache, cough, cardiac problem	

Table V: Summary of intoxication incidents recorded among producers 2/6

Chemicals	Pesticide Category	WHO Classification	CSP Registration	Type of incident	Number of cases	Intoxication Symptoms	Total number of Incidents
ROUNDUP 360 SL (glyphosate 360 g/l)	Herbicide	III	Yes	Skin	09	Itching, burns, skin rash, headache, respiratory problems, vomiting, eye burns	19
				Inhalation	04	Cold, headache, dizziness, skin rash, fever	
				Eye	03	Irritation, eye burns	
				Ingestion	03	Abdominal pains, nausea, abdominal swelling

RONSTAR (oxadiazon 200 g/l + propanyl 400 g/l)	Herbicide		No	Skin	01	Skin burns	01
TAMARIS	-	-	-	Skin	01	Itching, burns	01
TOPSTAR (Oxadiargyl 400 g/l)	Herbicide	III	Yes	Skin	01	Burns	01

With regard to incident frequency rate, GRAMOXONE alone (paraquat 200 g/l) has been implicated in 54 intoxication cases and is the product which has caused the most health problems among agricultural producers. Three other pesticide formulations containing paraquat, i.e. CALLOXONE SUPER (paraquat 200 g/l), GRAMOQUAT SUPER (paraquat chloride 200 g/l) and BENAXONE (paraquat chloride 200 g/l) have been reported to be implicated in 5 intoxication cases, bringing to 59 the total number of paraquat-related incidents. Caustic lesions which characterized the initial phase of paraquat intoxication were found to be symptoms affecting some of the patients. (Mégarbane, 2003).

The ROCKY 386 EC pesticide formulation (cypermethrine 36 g/l + endosulfan 350 g/l) comes second with 35 intoxication cases. Despite the fact that Endosulfan is banned in CILSS countries, it is still found in some pesticide formulations such as CAIMAN SUPER (alpha-cypermethrine 18 g/l + endosulfan 350 g/l) CAIMAN ROUGE (endosulfan 250 g/l + thirame 205 g/l) and ENDOCOTON 500 EC (endosulfan 500 g/l) which altogether have been incriminated in 11 intoxication cases, bringing to 46 the total number of endosulfan-related intoxication cases.

CONQUEST 176 EC (cyperméthrine 144 g/l + acétamipride 32 g/l) comes third with regard to incident frequency.

Exposure route distribution among the 296 poisoning cases

Figure 11 gives the exposure route distribution among poisoning cases

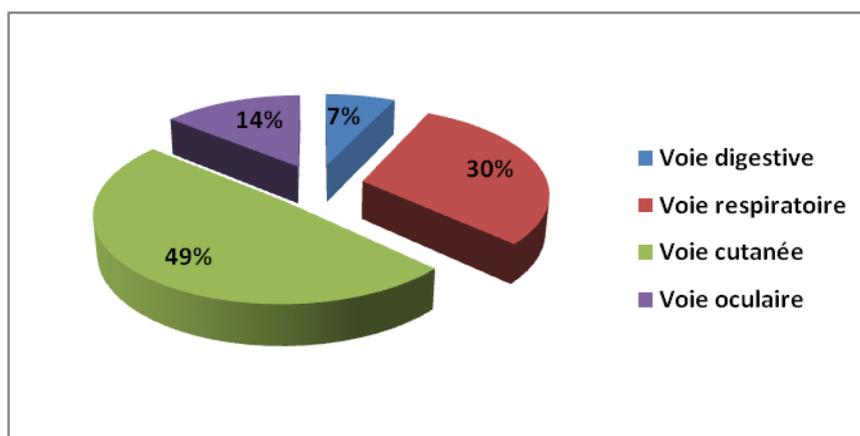

Figure 11: Exposure route distribution among poisoning cases

Ingestion, Inhalation, Dermal, Ocular,

The exposure route distribution is as follows: 145 contamination cases occur through dermal contact, 89 through the respiratory tract (inhalation), 40 through ocular contact and 22 cases through the digestive tract (ingestion). Dermal contact is the primary route of chemical

exposure and accounts for 49% of the reported cases which is evidence of the correlation between the prevalence of intoxication through dermal contact and the scarce use of overalls as protective clothing. In fact, as seen earlier, only 4.5% of agricultural producers wear overalls during pesticide application operations whereas 96% of them are using backpack sprayers.

IV-4-3. Management of poisoning incidents by farmers

Table VI summarizes farmers' behaviour following intoxication incidents and their rate of occurrence

Table VI: Farmers' behaviour after contact with plant protection products

Practices	Number	Percentage
Drink milk	54	8,32
Drink tamarind	15	2,31
Drink lemon juice	13	2,00
Drink sour juice	1	0,15
Drink sorrel juice	2	0,31
Drink Nescafé	2	0,31
Take paracetamol	1	0,15
Ingest charcoal and vomit	1	0,15
Go to healthcare center (CSPS)	25	3,85
Get rid of	7	1,08
Rub herself/himself with lemon leaves	20	3,08
Rub herself/himself with sorrel leaves	1	0,15
Rub herself/himself with vines	1	0,15
Apply ointment	1	0,15
Apply shea-butter	43	6,62
Wash with soap	540	83,20
Wash with potash soap	8	1,23
Wash with warm water	1	0,15
Wash with salted water	1	0,15
Suck sugar	1	0,15
No answer	8	1,23

As seen above a large proportion of farmers have recourse to traditional medicine. This is not surprising when it is known that 80% of the population in developing countries use medicinal plants to cure themselves (OMS, 2002). Only 3.08% of farmers go to healthcare service centres.

IV-4-4. Medical care and pesticide-related incidents

Medical care for pesticide-related incidents is not provided to agricultural producers. The cost of healthcare and medical exams has to be borne by farmers themselves. The study highlights the fact that there is no effective system to monitor farmers' health. It would be appropriate to take initiatives through existing health cooperatives or mutual healthcare scheme

or through the establishment of such structures to develop a medical surveillance programme and a healthcare scheme to deal specifically with health incidents related to the use of pesticides.

IV-5. Results of the survey carried out in health service centres

This section indicates the number of pesticide intoxication cases reported to health service centres. In total, 42 health centres of which 40 Health and Social Advancement Centres (CSPS) and two (2) Health centres with surgical facilities (CMA) have been covered by the present study. Intoxication incidents were divided into the three (3) following categories on the basis of the level of details that were provided:

IV-5-1. Pesticide intoxication cases reported without detailed information

922 cases falling into this category were found to have been reported to the 42 health centers since 2002. Table VII gives the intoxication case distribution according to the victims' region and province of origin. The Boucle du Mouhoun comes first with 46.10% of reported cases, followed by the Hauts Bassins region with 38.28% of cases, and the Cascades with 15.62% of intoxication cases.

Table VII: Distribution of the 922 intoxication cases reported with no detailed information according to the victims' place of origin

Region	Province	Number	Percentage per region	Total per region
Boucle du Mouhoun	Banwa	273	64.24%	425 (46.10%)
	Mouhoun	152	35.76%	
Cascades	Léraba	144	100%	144 (15.62%)
Hauts-Bassins	Houet	35	9.92%	353 (38.28%)
	Kéné Dougou	182	51.56%	
	Tuy	136	38.53%	
Total		922		(100%)

The present results support earlier findings from Toé *et al*, (2000 and 2002) confirming the prevalence of intoxication cases in the Mouhoun area. Due to data storage problems and staff mobility, some health centres were not able to consistently record intoxication cases that have occurred since 2002. As a result, the effective number of incidents cases should be higher than the one given here.

IV-5-2. Pesticide intoxication cases reported with brief information

They include intoxication cases for which basic information is available. The information provided is related to the identity of the injured person (sex and age), the incident circumstance and its outcome. A total of 81 recorded intoxication cases fall into this category. As seen below most of the incidents were recorded in the Boucle de Mouhoun region (49.3%), followed by the Hauts-Bassins area with 34.6% of cases and the Cascades region with 16% of cases. Table VIII gives the intoxication case distribution according to the relevant regions and provinces.

Table VIII: Distribution of the 81 intoxication cases reported with basic information according to the place of origin

Region	Province	Number	Percentage per region	Total per region
Boucle du Mouhoun	Banwa	1	2.5%	40 (49.3%)
	Mouhoun	39	97.5%	
Cascades	Léraba	13	100%	13 (16%)
Hauts-Bassins	Balé	1	3.57%	28 (34.6%)
	Houet	11	39.29%	
	Kénédougou	16	57.14%	
Total		81		81 (100%)

Distribution of the 81 intoxication cases according to sex and age

The majority of victims were women accounting for 70.37% of reported cases against 29.63% for men.

The largest proportion of victims were adults (54.33%) whereas 19.75% of them were minors and 17.28% adolescents. In 8.84% of the cases, age could not be identified. (See Figure 12).

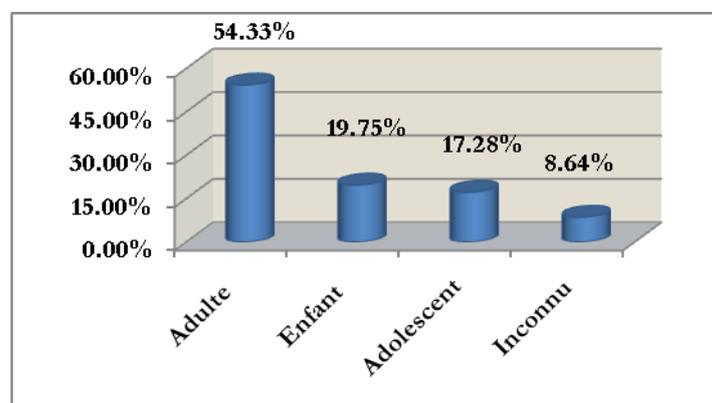

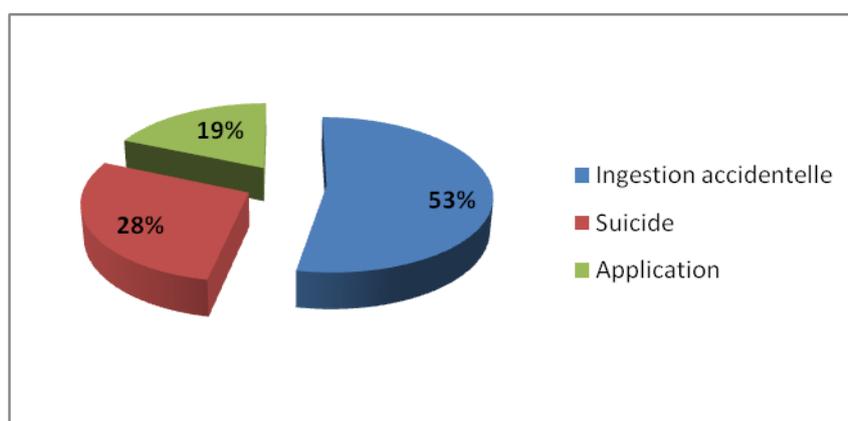

Figure 12: Age distribution among the 81 intoxication cases
Text in the Table (Adult/Child/Adolescent/Unknow)

Distribution of the 81 intoxication cases according to incident circumstances

The majority of intoxication cases (53%) were due to unintentional ingestion of pesticides by the victims (Figure 13). It has been observed that 19% of cases occurred during agricultural work involving the use of pesticides. This percentage corresponds to 15 individuals. The perusal of survey factsheets has revealed that only one person was wearing protective equipment at the time of the pesticide handling operation that led to the incident. As mentioned earlier, pesticide application operations without the use of personal protective equipment inevitably exposes applicators to high intoxication risks.

Unintentional ingestion/suicide/pesticide application

Figure 13: Distribution of the 81 poisoning cases according to incident circumstances

Application: intoxication incidents occurred during pesticide treatments in the field or while handling treated seeds.

Ingestion: in our context intoxication cases include:

Food intoxications: intoxications occurring after having ingested cereals which had been preserved with chemicals and used to cook meals. This raises the problem of the identification of appropriate pesticides for the preservation of stored food and of the compliance with recommended doses.

Cases resulting from a mistake: intoxications resulting from the ingestion of liquid or solid pesticide formulations which have been mistaken for water, drinks, food or medical substances. They indicate, on the one hand, how carelessly left-over pesticides or chemical stocks are managed and on the other hand, they highlight the lack of knowledge about the risks associated with pesticides.

Intoxications resulting from the use of empty containers: intoxications resulting from the consumption of water or food stored in empty pesticide containers which have not been previously decontaminated or properly cleaned.

Suicide: Some individuals facing personal problems try to commit suicide by ingesting pesticides.

Distribution of the 81 intoxication cases according to the year of occurrence of the incident

Figure 14 lists the number of intoxication incidents according to the year of occurrence.

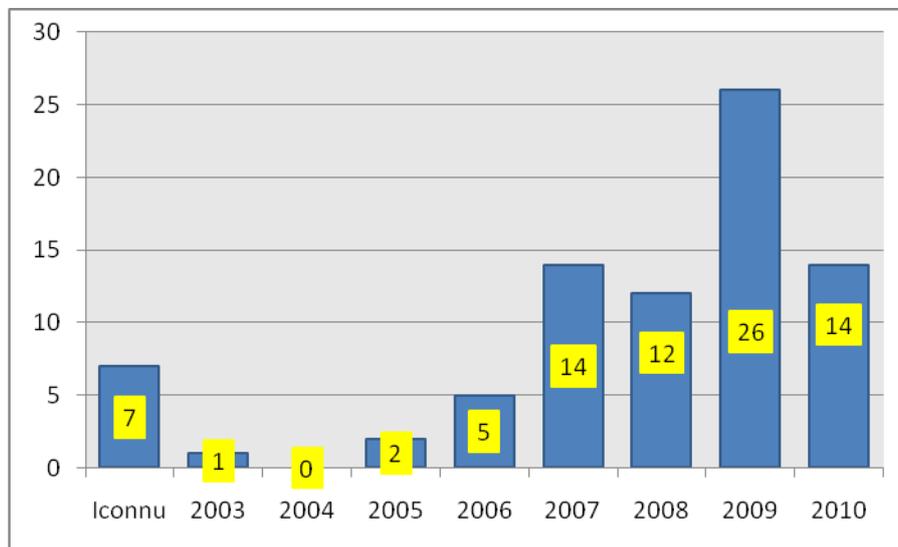

Figure 14: Distribution of the number of intoxication cases according to the year of occurrence.

As seen in Figure 14, the number of intoxication cases increases annually. With regard to 2010, the number of cases refers to the ones registered between January and the first two weeks of June, which implies that only the beginning of the winter season is taken into account.

Distribution of the 81 intoxication cases according to the outcome of the incident

The majority of victims, i.e. 80.25% have recovered whereas in 10% of cases, intoxication incidents were fatal. In 7.4% of cases, the outcome was unknown.

IV-5-3. Intoxication cases reported together with some detailed information

All recorded intoxication cases for which the implicated pesticide(s) was/were identified fall into this category. Overall, out of the 22 cases recorded, five (5) occurred during agricultural work involving the use of pesticides during application operations or the use of treated seeds. Six (6) of them result from the use of empty pesticide containers. Seven (7) cases are related to suicide and the four (4) remaining cases result from the ingestion of a chemical product which had been mistaken for a drink or a food substance. Table IX presents the intoxication symptoms related to the incriminated pesticides together with their active ingredients and corresponding concentrations.

Table IX: Intoxication cases (recorded within CSPA) where the incriminated pesticides and the poisoning circumstances of the incidents were clearly identified 1/3

Intoxication circumstance	Name of chemicals	Active ingredients and concentration	WHO Classification	Number of cases	Symptoms	Outcome
Application of agricultural pesticides or handling of pesticide-treated seeds	CAPT 88 EC	Acetamipride (16 g/l)	II	1	Dizziness, headache, blurred vision, vomiting	Recovery
		Cypermethrine (82 g/l)				
	CONQUEST 88	Cypermethrine (82 g/l)	II	1	Dizziness, excessive sweating, convulsion, staggering, excessive salivation, nausea and vomiting, restlessness, diarrhea	Recovery
		Profenofos (600 g/l)				
	GRAMOXONE	Paraquat (200 g/l)	II	2	Dizziness, headache, excessive sweating, blurred vision, hand tremor, convulsion, narrow pupils/miosis, staggering, excessive salivation excessive, nausea and vomiting	Recovery
	PROCOT 40 WS		Carbosulfan (250 g/kg)	II	1	Abdominal pain
Carbendazim (100 g/kg)						
Metalaxyl-M (50 g/kg)						

Table IX: Intoxication cases (recorded within CSPS) where the incriminated pesticides and the poisoning circumstances of the incidents were clearly identified 2/3

Intoxication circumstance	Name of chemicals	Active ingredients and concentration	WHO Classification	Number of incidents	Symptoms	Outcome
Handling of packagings or consumption of food which had been placed in empty pesticide containers	CALTHIO C	Chlorpyrifos-ethyl (250g/l)	-	1	Excessive sweating, convulsion, excessive salivation	Death
		Thirame (250 g/l)				
	GRAMOXONE	Paraquat (200 g/l)	II	1	Dizziness, convulsion, staggering, excessive salivation, nausea and vomiting	Recovery
	DECIS 25 EC	Deltamethrine (25 g/l)	II	3	Excessive sweating, blurred vision, hand tremor, convulsion, staggering, excessive salivation excessive, nausea and vomiting	Transfer
	ADWUMA WURA	Glyphosate (480)	III	1	Headache, excessive sweating, blurred vision, hand tremor, excessive salivation, nausea and vomiting	Recovery
	FURADAN	Carbofuran (5%)	-	1	Headache, excessive sweating, blurred vision, hand tremor, excessive salivation, nausea and vomiting	Recovery
	LAMDEX 480 EC	Lambdacyhalothrine (30 g/l)	II	1	Dizziness, headache, excessive sweating, convulsion, excessive salivation, nausea and vomiting	Recovery
		Chlorpyrifos-ethyl (400 g/l)				
CAIMAN ROUGE	Endosulfan (250 g/l)	II	1	Dizziness, headaches, convulsion, nausea and vomiting, restlessness	Recovery	

Table IX: Intoxication cases (recorded within CSPS) where the incriminated pesticides and the incident circumstances were clearly identified 3/3

Intoxication circumstance	Name of chemicals	Active ingredients and concentration	WHO Classification	Number of incidents	Symptoms	Outcome
Suicide	ROCKY C 386 C	Endosulfan (350 g/l) Cypermethrine (36 g/l)	III	3	Headaches, profuse sweating, convulsion, excessive salivation, nausea and vomiting	Transfer and recovery
	ROCKY 350 EC	Endosulfan (350 g/l)				
	DECIS	Deltamethrine (25 g/l)	II	1	Profuse sweating, excessive salivation, nausea and vomiting, convulsion	Transfer
	CALTHIO DS	Endosulfan (25%) Cypermethrine (25%)	-	1	Restlessness, delirium	Death
		CAPT 80 DS				
	Confusion over the pesticide (liquid formulation) and a drink (including water) or a food or medical powder	ROCKY 350 EC	Endosulfan (350 g/l)	II	1	No description
FURADAN		Carbofuran (5%)	-	1	No description	Death
LAMDEX 480 EC		Lamdacyhalothrine (30 g/l) Chlorpyrifos-ethyl (400 g/l)	II	1	Dizziness, headaches, profuse sweating, convulsion, excessive salivation, nausea and vomiting	Death
		CAIMAN ROUGE				

Out of the seventeen injured individuals, fifteen (15) were men (i.e. 77.3%) and five (5) were women (27.7%). The incidents occurred between 2003 and 2010 and have increased from 1 to 5 over the years (Figure 16).

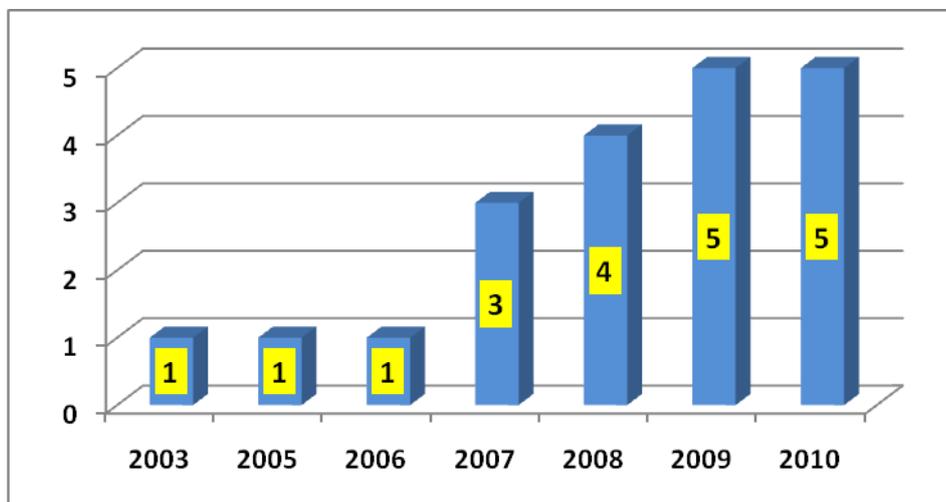

Figure 16: Distribution of the 22 intoxication cases according to the year of occurrence

IV-5-4. Capacity to deal with intoxication incidents

Overall, it has been found that health personnel have little information about pesticides. Out of the 42 surveyed health officers, 20 (47.62%) declared not having much knowledge about pesticides whereas twenty-two (22), i.e. 52.37% knew some facts about pesticides; each of them were able to quote some of the pesticide formulations' names. On the basis of the frequency with which chemicals were quoted, it has been found that GRAMOXONE and ROUNDUP were the best known ones (respectively quoted by 17 and 15 agents). Some pesticides were quoted at the most by three (3) agents only. They are: ALLIGATOR, ATRALM, ATRAZINE, CALTHIO, CONQUEST, COTODON, DECIS, ENDOSULFAN, GLYPHADER, HERBEXTRA, KALACH, RAMBO, ROCKY and TOUCHDOWN.

The lack of knowledge about pesticides presents a serious handicap in that it inhibits dealing effectively with intoxication incidents. In fact, only a correct and complete etiology of pesticide-related ailments can help to provide the appropriate treatment. However, it has been observed, through data collection on intoxication cases at health centres' level, that, in most situations, diagnostics carried out did not identify the incriminated pesticides, in which case, the administered cure can only be inadequate or even have adverse effects on patients' health. In most intoxication cases, and independently of the route of exposure and of the pesticide formulation implicated, active charcoal and atropine were the only forms of treatment provided. Medical care related to intoxication cases is definitely insufficient.

The study also reveals that there is a tendency among people, who are usually characterized by a low level of education, not to talk much about pesticide poisoning issues. As a consequence, incident cases, if they are ever reported to health centres tend to be reported late. Poisoning victims only go to health care centres once they realize that their life is endangered. According to health agents, most of the intoxication victims coming to the centres do not immediately admit that their ailments are related to pesticide intoxication. A long and complex investigation is required before patients finally reveal the cause of their problems.

V- CONSTRAINTS AND LIMITS OF THE STUDY

V-1 Constraints of the study

At the farmers level, the major difficulties we encountered were related to:

- their unavailability as the survey took place at the peak of the winter season when they were busy with preparatory field work and sowing;
- their reluctance to speak about issues related to experienced and observed intoxication cases;
- Their illiteracy and thus their ignorance of the brand names of products they used, which makes it difficult to identify incriminated chemicals;
- Their lack of knowledge on pesticide-related symptoms;

At the health personnel's level, the major difficulties we came across were related to:

- The unavailability of activity reports or registers in some of the health centres visited due partly to staff mobility;
- The refusal of some patients to talk about their accident;
- The tendency for the injured to be cured at home with traditional practices, in which case, incidents were not reported to health centres;
- The lack of information on the identity of pesticides and on the poisoning incident circumstances in patients' personal records.

At the pesticide distributors and retailers level, their distrust towards interviewers and their unwillingness to answer questions.

V-2 Limits of the study

One of the limits of the study is related to the data collection method. Data on pesticide intoxication incidents was collected by means of prospective surveys and interviewers found themselves confronted by the unavailability of information regarding the identification of pesticide formulations implicated in poisoning incidents, the incident circumstances, the protection measures taken for pesticide handling and use and precautionary measures.

The fact that it was not possible to verify if precautionary measures intended for farmers were effectively taken during pesticide treatments constitutes another limit of the survey. A farmer could well report wearing personal protective equipment for pesticide applications while not doing so in reality.

VI- RECOMMENDATIONS

- ☞ Given the economic importance of pesticide trade for distributors and retailers, and
- In view of the low level of education and training among most pesticide distributors and retailers,
- In view of the role that distributors and retailers play in pesticide management processes through the advice they can provide to farmers,
- Noting the government's commitment to play a central role in controlling agro-chemicals through the National Commission on the Control of Pesticides,

We would then recommend:

- ✓ Supporting the strengthening of capacities to control the distribution of pesticides in the study zone in particular and in the whole country,
- ✓ organizing training sessions with a view to disseminating knowledge on the hazards associated with pesticides, the relevant techniques of use and tools on the management of left-over pesticides and empty containers.

☞ Given the high incidence of health problems resulting from the use of pesticides on farmers, and

- In view of the low level of education among the population,
- In view of their lack of knowledge about pesticides and the hazards associated with them,
- In view of the inexistence of training among them,
- In view of the lack of a health surveillance plan of action,
- In view of the limited knowledge of pesticides amongst health personnel,
- In view of the difficulties in providing medical care to intoxicated individuals,

We would then recommend:

- ✓ organizing training sessions aimed at farmers using pesticides,
- ✓ implementing a health surveillance plan to monitor farmers,
- ✓ organizing training sessions aimed at health agents.

Given the objective of the PIC Procedure under the Rotterdam Convention, and

- In view of the lack of human and material resources of the Directorate of Plant Protection (DPV),

- In view of the difficulties encountered by health research units and healthcare centres,

We would then recommend that FAO/PIC supports and helps strengthen the Crop Protection Directorate (DPV), health research units and healthcare centres capacities.

CONCLUSION

The overall objective of the present study is to contribute to achieving improvements in human health and to protect the environment. The work which has been conducted has enabled us to list the range of pesticides marketed in the study zone, to identify and describe health problems associated with the use of pesticides affecting farmers as well as associated risk factors.

A total of 153 pesticide formulations were recorded in the 97 establishments involved in pesticide distribution and trade. But despite the large number of agro-chemicals on the market, little efforts have been made to help minimize health and environmental risks associated with their use.

By recognizing the possible adverse effects of pesticides on human-beings, different categories of animals, plants, water and soil, the majority of farmers have shown to be aware of health and environmental risks resulting from the use of agro-chemical products. However, such knowledge has not necessarily led them to adopt responsible attitudes and to manage pesticides in a safer manner. In fact, personal protective equipment is only worn by a very limited number of workers, either out of carelessness or because farmers cannot afford them (only 0.31% of farmers use the personal protective equipment recommended. This sad fact highlights the non-compliance with Good Agricultural Practices. Similarly, irresponsible behaviour causing health and environmental damage such as, storing pesticides in sleeping rooms and exposing family members without informing them, using inappropriate products for domestic purposes, dumping empty containers into the environment or burying them in the soil, remain very common.

Data collected to assess the adverse effects of pesticides on farmers highlights the recurrence of health problems related to the use of agro-chemicals. Out of 42 surveyed health centres, 922 pesticide-related poisoning cases have been recorded since 2002. In 22 of those cases, the incriminated pesticide formulations and the incident circumstances were identified. Five of the 22 cases occurred during pesticide applications in the fields. 296 intoxication cases which occurred during pesticide treatments were reported among agricultural producers. Paraquat, which has been implicated in 59 poisoning incidents has been identified as the most hazardous active ingredient found in pesticide formulations. Formulations containing the combination of endosulfan/cypermethrine come second and have been found to be responsible for 35 poisoning cases. Present or delayed manifestations of pesticide exposure which affect 82.66% of farmers highlights the constant threat that pesticides pose to human health and their possible toxic chronic effects.

In view of their severe adverse effects on farmers, and in order to protect human health and the environment, special attention should be brought to active ingredients such as paraquat or endosulfan to effectively ban them and propose them for inclusion in Annex III of the Rotterdam Convention. To this purpose, advanced investigations together with more in-depth studies should be carried out over a longer period of time to complement the present pilot study. Further studies should be undertaken through the joint collaboration of health centres and agricultural services in order to have a better understanding of the different types of intoxication cases.

It is then highly recommended to strengthen the Directorate for Plant Protection capacities (DPV), as well as that of health research units and healthcare centres.

ANNEXES

Annex 1: Questionnaire aimed at pesticide distributors/retailers

QUESTIONNAIRE		
<i>“Study on Agro-chemical Poisoning in Agriculture (Burkina Faso Pilot Study)”</i>		
Form aimed at pesticide distributors/retailers		
Date: /__/__/ - /__/__/ - 2010	Sheet n° /__/__/	Location code: /__/__/
	Investigator code /__/__/	Department:
1. RESPONDENT IDENTITY		
Occupation:	Structure name:	
2. PRODUCT IDENTITY		
See Form in Annex		
3. PESTICIDE MANAGEMENT		
3.1. Do you have unused pesticides that have been returned by farmers in your building? Yes /__/ no /__/		
3.1.1. If yes, what do you do with them?.....		
3.2. Do you know of any other sources of pesticide supply for farmers? Yes /__/ no /__/		
3.2.1. If yes, which ones?		
3.3. Do you have a pesticide warehouse? Yes /__/ No /__/		
If yes: 3.3.1. Is the storage facility appropriate? Yes /__/ No /__/		
3.3.2. What type of storage is it? Seggregated /__/ Unsegregated/__/		
3.3.3. Do you have a trained warehouse person?: Yes /__/ No /__/		
3.3.4. Is there a storage data sheet? Yes /__/ No /__/		
3.4. Is there a safety data sheet: Yes /__/ No /__/		
3.5. How are pesticide stocks managed? packaging/__/ repackaging/__/		
3.6. Is there a First-Aid-Kit? Yes /__/ no /__/		
3.6.1. If yes, what does it contain?		
3.7. What do you do with empty pesticide packagings?		
4. PREVENTION AND PROTECTION MEASURES		
4.1. Do you know about any potential risks related to the use of pesticides (or the exposure to pesticides)? Yes /__/ no /__/		
4.1.1. If yes, which ones?.....		
4.2. Do you provide your customers with information on:		
4.2.1. The risks associated with the use of pesticides? Yes /__/ no /__/		
4.2.2. Proper pesticide handling techniques? Yes /__/ no /__/		
4.3. Are there any training sessions on the use of pesticides aimed at farmers? Yes /__/ no /__/		
4.3.1. If yes, with which frequency (number of times per year)?		
4.3.2. Are the training sessions free? Yes /__/ no /__/		
4.4. Is there any personal protective equipment made available to customers? Yes /__/ no /__/		
4.4.1. If yes, which ones? Gloves /__/ boots /__/ aprons /__/ overalls /__/ glasses /__/ Cartridge masks /__/ dust masks /__/ other /__/		
4.5. Do you think that these products have adverse effects on health? Yes /__/ No /__/		
4.5.1. If yes, why?		
4.5.2. If not, why?		

.....

4.6. Do you think that these products pose a threat to the environment? Yes /___/ No /___/

4.6.1. If yes, why?

.....

4.6.2. If not, why?

.....

5. SUGGESTIONS AND RECOMMENDATIONS

5.1. Please provide your suggestions/recommendations regarding the use of pesticides in general

.....

.....

Thank you for your attention!!!

Annex 2: Questionnaire aimed at farmers

QUESTIONNAIRE		
<i>“Study on Agro-chemical Poisoning in Agriculture (Burkina Faso Pilot Study) ”</i>		
Questionnaire aimed at farmers		
Date: /__/__/ - /__/__/ - 2010	Sheet n° /__/__/__/ Investigator code /__/__/	Location c Departmen
1. RESPONDENT IDENTITY		
1.1. Age /__/__/	1.2. Sex M /__/ F /__/	1.3. Occupation:
1.4. Level of education: None /__/ Primary /__/ Secondary /__/ Tertiary /__/		
1.5. Literacy language: French /__/ Local language /__/		
2. KNOWLEDGE ABOUT THE PESTICIDE		
2.1. Which pesticides do you use? (Please specify names and their physical aspect: solid, liquid or gas substance)		
2.1.1. If the farmer does not know product names, ask her/him why?		
2.2. Do you know the following products, GRAMOXONE, CALLOXONE, atrazine, endosulfan? Yes /__/ No /__/		
2.2.1. If yes, which of these products do you use?		
2.3. How do you acquire products you are using? At the local market /__/ at a licensed retailer /__/ at SOFITEX /__/ Other		
2.4. Do you think you incur risks when you are exposed to those chemicals? Yes /__/ No /__/		
2.4.1. If yes, which risks?		
2.5. Have you already had an incident related to the use of those products? Yes /__/ No /__/		
If yes:		
2.5.1. Specify the type of incident: skin /__/ inhalation /__/ ingestion /__/ eye /__/		
2.5.2. Specify the product name:		
2.5.3. Describe experienced symptoms:.....		
2.6. What was your reaction in this situation?		
2.7. Have you already seen a person injured while using these products? Yes /__/ No /__/		
2.7.1 If yes: Which year? Indicate : Her/his name; Her/his age /__/__/ yrs; Her/His sex M /__/ F /__/ Specify the type of incident: skin /__/ inhalation /__/ ingestion /__/ eye /__/ Specify the product name: Describe observed symptoms.....		
2.8. What do you think of those products/what is your opinion on those products?		

-
- 2.9. What do you do with empty pesticide containers?
- 2.10. If there are unused products left, what do you do with them?

3. CONDITIONS IN WHICH THE PRODUCT WAS USED

- 3.1. Since when have you been using pesticides?
- 3.2. Do you wear any protective equipment during pesticide applications? Yes /___/ No /___/
- 3.2.1. If yes, which ones? gloves /___/ boots /___/ aprons /___/ overalls /___/ glasses /___/
 cartridge mask /___/ dust mask /___/ other /___/
- 3.2.2. If not, why?.....
- 3.3. Are you satisfied with this equipment? Yes /___/ No /___/
- 3.3.1. If not, why?
- 3.4. What type of equipment do you use to apply those pesticides?
 Backpack sprayer /___/ hand sprayers (ULV, UBV) /___/ Other (specify name) /___/
- 3.5. What is the tank volume of this equipment? litres
- 3.6. What quantity of pesticide is applied per hectare? litres/ha
- 3.7. Are the pesticides ready for use? /___/ or to be diluted /___/.
- 3.7.1. If diluted, give the quantity of pesticide used per litre of water:/..... litre of water
- 3.8. How big is the area you treat during an agricultural season? hectares
- 3.9. How many treatments do you apply during an agricultural season?
- 3.10. In which month of the year do you apply: The first treatment? The last treatment?
- 3.11. Which amount of product do you handle? per day /___/ per week /___/ per month /___/
- 3.12. Have you had any training related to the use of pesticides? Yes /___/ No /___/
- 3.12.1. If yes: - date of the training received: - through which structure?
- what do you remember of the training?
-
- 3.15. After having treated a field, how long does it take before you come back to the same field?
- 3.16. After exposure, what do you usually do?

4. HEALTH EFFECTS

- 4.1. What do you feel during the use and/or handling of those products?

- 4.2. What do you feel after your work?
- 4.2.1. In the following hours:

- 4.2.2. In the following days:

- 4.3. Do you have any medical follow-up related to the use of those products? Yes /___/ No /___/
- 4.4. Do you see a general practitioner? Yes /___/ No /___/
- 4.4.1. If yes: once a/year /___/ twice a /year /___/ other /___/
- 4.5. Do you have any medical care protection in case of disease?:
 Individual /___/ Mutual or cooperative/___/ Other /___/

5. PERCEPTION OF ENVIRONMENTAL RISK

- 5.1. Is there any water source (well, stream, river, forage,) in the vicinity or in your fields?
 Yes /___/ No /___/
- 5.1.1. If yes, specify
- 5.1.2. What is the distance between the water source and the area you are treating?

- 5.1.3. What is the water source used for?
- 5.2. Have you noticed the death or disappearance of some insects or animals since you have been using the chemicals?
Yes /___/ No /___/
- 5.2.1. If yes, which ones?
- 5.3. Do you think that those products pose a risk to the environment? Yes /___/ No /___/
- 5.3.1. If yes, why?
- 5.3.2. If not, why?

6. SUGGESTIONS AND RECOMMENDATIONS

- 6.1. Please provide your suggestions/recommendations concerning the use of pesticides in general.
-

Annex 3: Questionnaire aimed at health officers 1/2

56.	Trichlopyr									

Annex 6: Pesticide formulations which were identified during the survey among dealers/vendeurs

N°	Formulation	Type of formulation	Active ingredients	Concentrations	Pesticide category	WHO Classification	Chemicals' sources	Dealers' source of supply	Registration CSP*
1.	ACEPRONET 400	EC	Acetochlore	250	Herbicide	III	China	Mali	No
			Prometryne	150					
2.	ACTELIC SUPER	WG	Pyrimiphos-methyl	16	Insecticide		France	Burkina	No
			Permethrine	32					
3.	ACTELIC 50	EC	Pyrimiphos-methyl	500	Insecticide	III	Switzerland	Burkina	Yes
4.	ACTELIC SUPER		Pyrimiphos-methyl	16	Insecticide		SAPHYTO	Burkina	No
			Permethrine	3					
5.	ACTION 80 DF	DF	Diuron	800	Herbicide		SCAB	Cameroon	No
6.	ADWUMA WURA	SL	Glyphosate	480	Herbicide		China	Ghana	No
7.	ADWUMA WURA 75.7%	GR	Glyphosate	757	Herbicide		China	Ghana	No
8.	ADWUMAMU HENE		Glyphosate	410	Herbicide			Ghana	No
9.	AGRAZINE 500	SC	Atrazine	500	Herbicide		China	Burkina/Ghana	No
10.	AGRAZINE 80 WP	WP	Atrazine	800	Herbicide		France/China	Ghana/Burkina	No
11.	AGRAZINE 90	DF	Atrazine	900	Herbicide		China/France	China	No
12.	AGRAZINE DF	WG	Atrazine	900	Herbicide		France		No
13.	AKIZON 40 SC	SC	Nicosulfuron	40	Herbicide	III	France	Burkina	Yes
14.	ALLIGATOR 400 EC	EC	Pendimethaline	400	Herbicide	III	France	Burkina, Mali	Yes
15.	APRON PLUS 50 DS	DS	Metalaxyl-M	100	Insecticide			Ivory Coast	
			Carboxine	60					
			Furathiocarbe	340					
16.	APRON STAR 42 WS	WS	Thiamethoxam	20%	Insecticide		Switzerland		

			Metalaxyl-M	20%					
			Difenoconazole	2%					
17.	ATRAHERB	SC	Atrazine	50%	Herbicide		China	Ghana	No
18.	ATRALM 500	EC/SC	Atrazine	500	Herbicide		SENEFURA/SCAB	Burkina	No
19.	ATRALM 90	WG	Atrazine	900	Herbicide		SENEFURA	Burkina	No
20.	ATRAVIC 500 SC	SC	Atrazine	500	Herbicide		SAPHYTO	France	No
21.	ATRAZ 50	FW	Atrazine	500	Herbicide		Cantonments Accra	China	No
22.	ATRAZ 80 WP	WP	Atrazine	800	Herbicide		SARO AGROCHEM	Nigeria	No
23.	ATRAZILA 500	SC	Atrazine	500	Herbicide		Kumark Trading Ent.	China	No
24.	ATRAZILA 80 WP	WP	Atrazine	800	Herbicide		Shenzhen Baocheng Chemical industry co. Ltd	China, Ghana	No
25.	ATRAZINE		Atrazine		Herbicide		Japan	Ghana	No
26.	ATRAZINE WEEDICIDE		Atrazine		Herbicide		Japan	Ghana	No
27.	AVAUNT 150 EC	EC	Indoxacarb	150	Insecticide	II	SOFTTEX/SAPHYTO	Burkina	Yes
28.	BACCARA 335 EC	EC	Propanil	260	Herbicide		SAPHYTO	Burkina	No
			2,4 D	75					
29.	BENAXONE SUPER		Paraquat	270	Herbicide		Bentronic Productions	Ghana	No
30.	BEXTRA		2,4 D	720	Herbicide		CalliGhana/Ghana Bentronic Production	Ghana	No
31.	BISTAR 10 WP	WP	Bifenthrine	10%	Insecticide	II		Burkina	Yes
32.	BLAST 46 EC	EC	Lambdacyhalothrine	30	Insecticide		SAPHYTO	Chine	No
			Acetamipride	16					
33.	CAIMAN ROUGE	DP	Endosulfan	25%	Insecticide	II	SOFTTEX/SSI	Senegal	No
			Thirame	25%					
34.	CAIMAN SUPER	EC	Alphacypermethrine	18	Insecticide		SSI	China	No
			Endosulfan	350					
35.	CALFOS 500 EC	EC	Profenofos	500	Insecticide	II	SAPHYTO	Burkina	Yes

36.	CALLIFOR	WG	Prometryne	440	Herbicide		SAPHYTO		No
			Fluometuron	440					
37.	CALLIFOR 500	SC	Prometryne	250	Herbicide	III	SAPHYTO	France	Yes
			Fluometuron	250					
38.	CALLIFOR G	WG	Prometryne	250	Herbicide	III	SAPHYTO	France	Yes
			Fluometuron	250					
			Glyphosate	60					
39.	CALLIHERB	EC/SL	2,4 D of amine salt	720	Herbicide		SAPHYTO	France	No
40.	CALLIMAN 80 WP	WP	Manebe	80	Fongicide		Callivoire	Ivory Coast	No
41.	CALLITRAZ 90 WG	WG	Atrazine	900	Herbicide		SAPHYTO		No
42.	CALLOXONE SUPER	SL	Paraquat	200	Insecticide		SAPHYTO	Burkina	No
43.	CALRIZ	EC	Propanil	360	Herbicide		SAPHYTO	France	No
			Trichlopyr	72					
44.	CALTHIO C	WG/WS	Chlorpyrifos-ethyl	25%	Insecticide		SAPHYTO/FASOCOTON	France	No
			Thirame	25%					
45.	CALTHIO DS	DS	Lindane	25%	Insecticide		SAPHYTO	Burkina	No
			Thirame	25%					
46.	CALTHIO E	DP	Endosulfan	25%	Insecticide		SCAB	Burkina	No
			Thirame	25%					
47.	CAPT 80 EC	EC	Acetamipride	16	Insecticide		SAPHYTO	Ivory Coast, BF	No
			Cypermethrine	72					
48.	CAPT 88 EC	EC	Acetamipride	16	Insecticide	II	Ivory Coast /ALM	Ivory Coast/China	Yes
			Cypermethrine	72					
49.	CARBODAN 3% G		Carbofuran	30	Insecticide		Makhteshim Agan France	Ghana	No
50.	CELTACAL 12,5 EC	EC	Deltamethrine	12,5	Insecticide		SAPHYTO	France	No
51.	CIGOGNE	EC	Profenofos	150	Insecticide		STEPAC Abidjan	France	No

			Cypermethrine	36					
52.	CODAL gold 412,5 DC	EC	S-Metolachlore	162,5	Herbicide	III	SAPHYTO/SYNGENTA	Ivory Coast/Switzerland	Yes
			Prometryne	250					
53.	CONQUEST C 88 EC	EC	Cypermethrine	72	Insecticide	II	SAPHYTO	Burkina	Yes
			Acetamipride	16					
54.	CONQUEST C 176 EC	EC	Acetamipride	32	Insecticide	II	SAPHYTO	Burkina	Yes
			Cypermethrine	144					
55.	COTODON PLUS 500 EC	EC	Metolachlore	250	Herbicide	III	NOVARTIS	France	No
			Atrazine	250					
56.	COTONET 500 EC	EC	Metolachlore	333	Herbicide		DTE SA Chine	China	No
			Terbutryne	167					
57.	CURACRON 500 EC	EC	Profenofos	500	Insecticide	III	SOFTTEX	Ivory Coast	Yes
58.	CYPERCAL 25 EC	EC	Cypermethrine	25	Insecticide		SAPHYTO	France	
59.	CYPERCAL 50 EC	EC	Cypermethrine	50	Insecticide	III	SAPHYTO		No
60.	CYPERCAL P 690 EC	EC	Profenofos	600	Insecticide	II	SAPHYTO	Burkina	Yes
			Cypermethrine	90					
61.	CYPERPHOS	EC	Cypermethrine	36	Insecticide		Bayer crop science	Germany	No
			Triazophos	150			Bayer crop science	Germany	
62.	CYRENS 480 EC	EC	Chlorpyrifos-ethyl	480	Insecticide		SAVANA	France	No
63.	DECIS	EC	Deltamethrine	25	Insecticide		STEPC/Bayer crop science	Ivory Coast	Yes
64.	DECTACOL 12,5	EC	Deltamethrine	12,5	Insecticide		SAPHYTO	Burkina	No
65.	DIAFURAN	WG	Carbofuran	5%	Insecticide		SAPHYTO	France	No
66.	DIGA FAGALAN 360 SL	SL	Glyphosate	360	Herbicide	III	PROPHYMA/SAVANA	France/Cameroon	Yes
67.	DIURALM 80 WG	WG	Diuron	800	Herbicide	III	SENEFURA/ALM	ALM/China	Yes
68.	DOMINEX 100	GL	Alpha cypermethrine	100	Insecticide			USA	No
69.	DUREXA	WG	Chlorpyrifos-ethyl	3,50%	Insecticide		SAPHYTO	France	No

70.	ENDOCOTON 500 EC	EC	Endosulfan	500	Insecticide	Ib	SAPHYTO	Israel	No
71.	FANGA 500 EC	EC	Profenofos	500	Insecticide	II	SENEFURA	ALM	No
72.	FOCUS GLYPHOSATE 360 SL	SL	Glyphosate	360	Herbicide		SOFTTEX	France	No
73.	FOCUS Ultra 100 EC	EC	Cycloxydime	100	Herbicide	III	BASF/Tech Agro International	EU	Yes
74.	FURADAN 5G	GR	Carbofuran	5%	Insecticide		SCAB/FMC	Belgium	No
75.	FUSILADE	EC	Fluazifop-p-butyl	125	Herbicide	III	SCAB	Ivory Coast	No
76.	GALAXY 450 EC	EC	Clomazone	150	Herbicide		SENEFURA/SAPHYTO	Burkina	No
			Pendimethaline	300					
77.	GALLANT SUPER	EC	Haloxifop-R-methyl	104	Herbicide	III	Callivoire	France	Yes
78.	GARIL 432 EC	EC	Trichlopyr	72	Herbicide	II	SAPHYTO	Burkina	No
			Propanil	360

Annex 7: Chemicals used by agricultural producers

Formulation	Active ingredients	Pesticide category	WHO classification	CSP Registration
ACEPRONET 400 EC	Acetochlore 250 Prometryne 150	Herbicide	III	No
ACTION 80 DF	Diuron 800	Herbicide		No
ADWUMA WURA	Glyphosate 480	Herbicide		No
ADWUMAMU HENE	Glyphosate 410	Herbicide		No
AGRAZINE 90	Atrazine 900	Herbicide		No
AKIZON 40 SC	Nicosulfuron (40g/l)	Herbicide	III	Yes
APRON PLUS	Metalaxyl-M 100 Carboxine 60 Furathiocarbe 340	Fongicide		No
ATRALM 500 EC	Atrazine 500	Herbicide	U	No
ATRALM 500 SC	Atrazine 500	Herbicide	U	No
ATRALM 90 WG	Atrazine 900	Herbicide	U	No
ATRAVIC	Atrazine 500	Herbicide	U	No
ATRAZ 80 WP	Atrazine 800	Herbicide	U	No
ATRAZILA 500 SC	Atrazine 500	Herbicide	U	No
ATRAZINE	Atrazine	Herbicide	U	No
ATRAZILA 80 WP	Atrazine 800	Herbicide		No
AVAUNT 150 EC	Indoxacarb150	Insecticide	II	Yes
BENAXONE SUPER	Paraquat chloride 200	Herbicide		No
BLAST 46 EC	Lambda-cyhalothrine 30 Acetamipride 16	Insecticide		No
CAIMAN ROUGE	Endosulfan25% Thirame25%	Insecticide	II	No
CALFOS 500 EC	Profenofos (500g/l)	Insecticide	II	Yes
CALLIFOR	Prometryne (440g/l) Fluometuron (440g/l)	Herbicide	III	No
CALLIFOR 500 SC	Prometryne (250g/l) Fluometuron (250g/l)	Herbicide	III	Yes
CALLOXONE SUPER	Paraquat 200	Herbicide		No
CALRIZ	Propanil 360 Trichlopyr 72	Herbicide		No
CALTHIO	Endosulfan Thirame	Insecticide		No
CAPORAL 500 EC	Profenofos (500g/l)	Insecticide	II	Yes

CAPT 88 EC	Acetamipride (16g/l) Cypermethrine (72g/l)	Insecticide	II	Yes
CERETRAZ 500 SC				No
CODAL GOLD 412-5 DC	S-Metolachlore (162g/l) Prometryne (250g/l)	Herbicide	III	Yes
CONQUEST88 EC	Cypermethrine (72g/l) Acetamipride (16g/l)	Insecticide	II	Yes
CONQUEST 176 EC	Acetamipride (32g/l) Cypermethrine (144g/l)	Insecticide	II	Yes
COTODON PLUS GOLD 450 EC	s-métolachlore (245g/l) Terbutryne (196g/l)	Herbicide	III	No
COTODON PLUS 500 EC	Metolachlore (250g/l) Atrazine (250g/l)	Herbicide		No
CURACON 500 EC	Profenofos (500g/l)	Insecticide	III	Yes
CYPERCAL P 230 EC	Cypermethrine (30g/l) Profenofos (200g/l)	Insecticide	II	Yes
DIGA FAGALAN 360 SL	Glyphosate (360g/l)	Herbicide	III	Yes
DIURALM 80 WG	Diuron (800g/kg)	Herbicide	III	Yes
ENDOCOTON500 EC	Endosulfan (500g/l)	Insecticide	Ib	No
FANGA500 EC	Profenofos (500g/l)	Insecticide	II	No
FOCUS ULTRA100EC	Cycloxdime (100g/l)	Herbicide	III	Yes
FURY P 212 EC	Zeta-cyperméthrine (12g/l) Profenophos (200g/l)	Insecticide	II	Yes
FURY P 636 EC				No
GALLANT SUPER	Haloxypop-R-methyl (104g/l)	Herbicide	III	Yes
GALAXY450 EC	Clomazone 150 Pendimethaline 300	Herbicide		No
GARIL432 EC	Trichlopyr (72g/l) Propanil (360g/l)	Herbicide	II	No
GLYCEL	Glyphosate 41%	Herbicide	II	Yes
GLYPHADER 480 SL	Glyphosate480	Herbicide	III	No
GLYPHONET360 SL	Glyphosate (360g/l)	Herbicide	III	Yes
GRAMOQUAT SUPER	Paraquat chloride 200 (276)	Herbicide		No
GRAMOXONE SUPER	Paraquat (200g/l)	Herbicide	II	No
HERBALM	2,4 D (750g/l)	Herbicide		No
HERBEXTRA 720 SL	2,4 D (720g/l)	Herbicide	III	Yes
HERBICOTON DF	Fluometuron (440g/l) Prometryne (440g/l)	Herbicide	III	Yes

HERBICOTON 500SC	Fluometuron (250g/l) Prometryne (250g/l)	Herbicide	III	Yes
IKOKADIGNE	Haloxypop-R-methyl (104g/l)	Herbicide	II	Yes
KALACH 360 SL	Glyphosate (360g/l)	Herbicide	III	Yes
KALACH EXTRA 70SG	Glyphosate (700g/l)	Herbicide	III	Yes
KARATE MAX2,5 WG	Lambda-cyhalothrine (25g/l)	Insecticide	III	Yes
LAMBDACAL P 212 EC	Profenofos 600 Lambdacyhalothrine 36	Insecticide	II	Yes
LAMBDACAL P 636 EC	Profenofos (600g/l) Lambda-cyhalothrine (36g/l)	Insecticide	II	Yes
LASSO GD	Atrazine 180 Alachlore 300	Herbicide	III	No
MALO BINFAGA 720 SL	2,4 D (720 g/l)	Herbicide	II	Yes
NICOMAIS 40 SC	Nicosulfuron (400g/l)	Herbicide	III	Yes
NIVACRON				No
PRIMAGRAM 360	Atrazine S-Metalochlore	Herbicide		No

Institut du Sahel

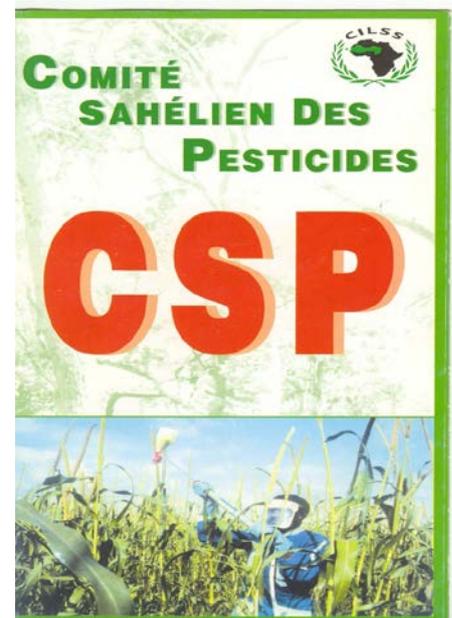

Liste positive des pesticides autorisés à la 34^{ème} session ordinaire du Comité Sahélien des Pesticides

En attendant la mise en place effective des structures du Comité Ouest Africain d'Homologation des Pesticides (COAHP), l'Institut du Sahel (INSAH) a organisé du **26 au 30 Mai 2014** à Bamako, la 34^{ème} session ordinaire du Comité Sahélien des Pesticides (CSP).

Après examen des points ci-après:

1. le suivi des recommandations de la 33^{ème} session ordinaire et l'examen du rapport d'activités du Secrétariat Permanent ;
2. l'évaluation des dossiers de demande d'homologation de pesticides ;
3. la situation des activités des Comités Nationaux de Gestion des Pesticides (CNGP) ;
4. des sujets divers relatifs au fonctionnement du CSP.

la session a abouti à la publication ci-dessous de la **liste positive des pesticides autorisés**.

*Pour plus d'informations s'adresser au
Secrétaire Permanent du Comité Sahélien des Pesticides basé à
L'Institut du Sahel à Bamako, Email : sylvain.ouedraogo@insah.org.*

GENERAL INFORMATION

for carbosulfan

Description: An insecticide for control of soil dwelling and foliar pests

Introduction: 1979, first reported; 1982, first introduced

EC Regulation 1107/2009 (repealing 91/414):

Status	Not approved
Dossier rapporteur/co-rapporteur	Belgium
Date inclusion expires	Expired

Approved for use (✓) or known to be used (#) in the following European countries: 

A	B	B	C	C	D	D	E	E	E	F	F	H	H	I	I	L	L	L	M	N	P	P	R	S	S	S	U
T	E	G	Y	Z	E	K	E	L	S	I	R	R	U	E	T	T	U	V	T	L	L	T	O	E	I	K	K

Also registered in: Australia

General status: 

Pesticide type	Insecticide, Nematicide
Substance group	Carbamate
Substance origin	Synthetic
Mode of action	Systemic with contact and stomach action. Acetylcholine esterase inhibitor.
CAS RN	55285-14-8
EC number	259-565-9

CIPAC number	417
US EPA chemical code	090602
Chiral molecule	No
Chemical formula	C ₂₀ H ₃₂ N ₂ O ₃ S
SMILES	<chem>c12c(CC(O2))(C)Ccccc1OC(N(SN(CCCC)CCCC)C)=O</chem>
International Chemical Identifier key (InChIKey)	JLQUFIHWVLZVTJ-UHFFFAOYSA-N
International Chemical Identifier (InChI)	InChI=1S/C20H32N2O3S/c1-6-8-13-22(14-9-7-2)26-21(5)19(23)24-17-12-10-11-16-15-20(3,4)25-18(16)17/h10-12H,6-9,13-15H2,1-5H3
Structure diagram/image available?	Yes
Molecular mass (g mol ⁻¹)	380.5
PIN (Preferred Identification Name)	2,2-dimethyl-2,3-dihydro-1-benzofuran-7-yl [(dibutylamino)sulfanyl]methylcarbamate
IUPAC name	2,3-dihydro-2,2-dimethylbenzofuran-7-yl (dibutylaminothio)methylcarbamate
CAS name	2,3-dihydro-2,2-dimethyl-7-benzofuranyl [(dibutylamino)thio]methylcarbamate
Other status information	-
Herbicide Resistance Classification (HRAC)	Not applicable
Herbicide Resistance Classification (WSSA)	Not applicable
Insecticide Resistance Classification (IRAC)	1A
Fungicide Resistance Classification (FRAC)	Not applicable
Physical state	Orange-yellow viscous liquid
Related substances & organisms	<ul style="list-style-type: none"> • zeta-cypermethrin • imidacloprid • pyridaben

Formulations:

Property 	Value
Example manufacturers & suppliers of products using this active	<ul style="list-style-type: none"> • Belchim • Fargro • Agrinon Enterprise Limited
Example products using this active	<ul style="list-style-type: none"> • Posse 10G • Marshal 10G • Advantage
UK LERAP status	None
Formulation and application details	Usually supplied as dry granules applied directly to soil or seed bed.

ENVIRONMENTAL FATE for carbosulfan

Property 	Value	Source/Quality Score/Other Information 	Interpretation 
Solubility - In water at 20°C (mg l ⁻¹)	0.11	A5	Low
Solubility - In organic solvents at 20°C (mg l ⁻¹)	Miscible	A5 - Acetone	-

Plants Carbofuran is quickly metabolised into 3-hydroxycarbofuran and ketocarbofuran. **Soil/Environment** DT_{50} in soil c. 30–60 d. Most important metabolite is CO_2 formed by microbiological degradation of the phenol compounds. $K_{oc} = 22$.

110 carbosulfan

Insecticide

carbamate

NOMENCLATURE

Common name carbosulfan (BSI, ANSI, draft E-ISO, (m) draft F-ISO)

IUPAC name 2,3-dihydro-2,2-dimethylbenzofuran-7-yl (dibutylaminothio)=methylcarbamate

Chemical Abstracts name 2,3-dihydro-2,2-dimethyl-7-benzofuranyl [(dibutylamino)thio]methylcarbamate

CAS RN [55285-14-8] **Development codes** FMC 35 001

Official codes OMS 3022

PHYSICAL CHEMISTRY

Mol. wt. 380.5. **M.f.** $C_{20}H_{32}N_2O_3S$ **Form** Orange to brown clear viscous liquid.

B.p. 124–128 °C **V.p.** 0.041 mPa (25 °C) **S.g./density** 1.056 (20 °C)

Solubility In water 0.3 ppm (25 °C). Miscible with most organic solvents, e.g. xylene, hexane, chloroform, dichloromethane, methanol, ethanol, acetone, etc. **Stability** Hydrolysed in aqueous media; DT_{50} (25 °C) in pure water <1 h (pH 4), 22 h (pH 6), 7.6 d (pH 7), 14.2 d (pH 8), >58.3 d (pH 9). **F.p.** 95 °C (closed cup)

COMMERCIALISATION

History Insecticide reported by E. C. Maitlen & N. A. Sladen (*Proc. Br. Crop Prot. Conf.*, 1979, 2, 557). Introduced by FMC Corp. **Manufacturers** FMC; Kuo Ching

APPLICATIONS

Biochemistry Cholinesterase inhibitor; activity is due to *in vivo* cleavage of the N-S bond, resulting in conversion to carbofuran. **Mode of action** Systemic

insecticide with contact and stomach action. **Uses** Control of a wide range of soil-dwelling and foliar insect pests. Examples of uses include control of millipedes, springtails, symphylids, wireworms, pygmy mangold beetles, frit flies, white grubs, aphids, caterpillars, flea beetles, Colorado beetles, stem borers, leafhoppers, planthoppers, codling moth, scales and free-living nematodes. The product is used in a wide range of crops, e.g. cotton, sugar beet, potato, rice, top fruit, citrus, maize, vegetables, sugar cane and coffee. **Formulation types** GR; EC; WP; DP; UL; CS. **Mixtures** (carbosulfan +) endosulfan; zeta-cypermethrin. **Compatibility** Compatible with liquid fertilisers. **Selected tradenames** 'Marshal' (FMC)

ANALYSIS

Product analysis by rp hplc (CIPAC Handbook, 1992, E, 35). **Residues** determined by glc (B. Leppert et al., *J. Agric. Food Chem.*, 1983, **31**, 220; 1984, **32**, 1441) or by hplc. Details available from FMC Agricultural Chemicals Group.

MAMMALIAN TOXICOLOGY

Reviews *Pesticide residues in food - 1986*. FAO Plant Production and Protection Paper 77, 1986. *Pesticide residues in food - 1986 evaluations*. FAO Plant Production and Protection Paper 78/2, 1987. **EHC 64** (WHO, 1986; a review of carbamate insecticides in general). **Oral** Acute oral LD₅₀ for male rats 250, female rats 185 mg/kg. **Skin and eye** Acute percutaneous LD₅₀ for rats >2000 mg/kg. Slight eye irritant; moderate skin irritant. **Inhalation** LC₅₀ (1 h) for male rats 1.53, female rats 0.61 mg/l air. **NOEL** (2 y) (oncogenic) for rats and mice 20 mg/kg diet. **ADI** (JMPR) 0.01 mg/kg b.w. [1986]. **Toxicity class** WHO (a.i.) II; EPA (formulation) I (4 EC), II (2.5 EC)

ECOTOXICOLOGY

Birds Acute oral LD₅₀ for mallard ducks 8.1, quail 82, pheasants 20 mg/kg. **Fish** LC₅₀ (96 h) for bluegill sunfish 0.015, trout 0.045 mg/l. **Bees** Toxic to bees. **Daphnia** LC₅₀ (48 h) 1.5 µg/l. **Algae** (96 h) 20 mg/l.

ENVIRONMENTAL FATE

Animals In rats, following oral administration, rapidly metabolised by hydrolysis, oxidation and conjugation, forming carbofuran methylol, carbofuran phenol, and their 3-hydroxy and 3-keto derivatives; the metabolites are rapidly excreted. **Plants** Metabolites include carbofuran (q.v.) and 3-hydroxycarbofuran. **Soil/Environment** In soil, rapidly degraded under both aerobic and anaerobic conditions, DT₅₀ c. 2-5 d; DT₉₀ <3-38 d; the principal metabolite is carbofuran (q.v.). Under field conditions, carbosulfan and carbofuran are unlikely to leach to groundwater.

[(dibutylamino)thio]méthylcarbamate de 2,3-dihydro-2,2-diméthyl-7-benzofuryle

Créé le 02/03/10

Le **carbosulfan** est une [substance active](#) de [produit phytosanitaire](#) (ou [produit phytopharmaceutique](#), ou [pesticide](#)), qui présente un effet [insecticide](#), et qui appartient à la famille chimique des [carbamates](#). Du fait de sa toxicité, le carbosulfan est interdit en France depuis le 13 décembre 2008³.

Réglementation[\[modifier\]](#) | [modifier le code](#)

Sur le plan de la réglementation des produits phytopharmaceutiques :

- pour l'[Union européenne](#) : cette substance active est interdite par la décision 2007/415/CE à la suite de l'examen relatif à l'inscription à l'annexe I de la [directive 91/414/CEE](#). Les autorisations en vigueur concernant les produits phytopharmaceutiques contenant du carbosulfan devront être retirées avant le 13 décembre 2007. À compter du 16 juin 2007, aucune autorisation ne peut être accordée ou reconduite pour les produits phytopharmaceutiques contenant cette substance. (décision du 13/06/2007, 2007/415/CE : JOUE L 156, 16 juin 2007).
- pour la [France](#) : cette substance active n'est pas autorisée dans la composition de [préparations](#) bénéficiant d'une [autorisation de mise sur le marché](#). Les dates limites d'écoulement des stocks sont fixées par l'avis au Journal Officiel du 4 septembre 2007 au 30 mai 2008 à la distribution, et au 13 décembre 2008 à l'utilisation.

Cependant, ce produit serait toujours vendu en France par [Belchim](#)⁴.

Caractéristiques physico-chimiques[\[modifier\]](#) | [modifier le code](#)

Les caractéristiques physico-chimiques dont l'ordre de grandeur est indiqué ci-après, influencent les risques de transfert de cette substance active vers les eaux, et le risque de [pollution des eaux](#) :

- [Hydrolyse](#) à [pH](#) 7 : instable,
- [Solubilité](#) : 0,3 mg·l⁻¹,
- [Durée de demi-vie](#) : 4 jours. Ce paramètre, noté [DT50](#), représente le potentiel de dégradation de cette substance active, et sa vitesse de dégradation dans le sol.

- [Coefficient de partage octanol-eau](#) : 2,19. Ce paramètre, noté [log Kow](#) ou [log P](#), mesure l'[hydrophilie](#) (valeurs faibles) ou la [lipophilie](#) (valeurs fortes) de la substance active.
- Formule chimique (IUPAC): 2,3-dihydro-2,2-dimethylbenzofuran-7-yl (dibutylaminothio)methylcarbamate

Écotoxicologie[[modifier](#) | [modifier le code](#)]

Sur le plan de l'[écotoxicologie](#), les [concentrations létales 50 \(CL50\)](#) dont l'ordre de grandeur est indiqué ci-après, sont observées :

- [CL50](#) sur [poissons](#) : 0,0015 mg·l⁻¹,
- [CL50](#) sur [daphnies](#) : 0,0015 mg·l⁻¹,

Toxicité pour l'homme[[modifier](#) | [modifier le code](#)]

Sur le plan de la [toxicité](#) pour l'[Homme](#), la [dose journalière acceptable \(DJA\)](#) est de l'ordre de : 0,01 mg·kg⁻¹·j⁻¹.
